[46185] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3302 (VGAM3302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46186] VGAM3302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3302 was detected is described hereinabove with reference to Figs. 2–8.

[46187] VGAM3302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46188] VGAM3302 gene, herein designated VGAM GENE, encodes a VGAM3302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3302 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3302 precursor RNA is designated SEQ ID:74160, and is provided hereinbelow with reference to the sequence listing part.

[46189] VGAM3302 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46190] An enzyme complex designated DICER COMPLEX, dices the VGAM3302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3302 RNA is designated SEQ ID:74161,

and is provided hereinbelow with reference to the sequence listing part.

[46191] VGAM3302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46192] VGAM3302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3302 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46193] The complementary binding of VGAM3302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3302 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46194] It is appreciated that VGAM3302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3302 host target genes. The mRNA of each one of this plurality of VGAM3302 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3302 RNA, herein designated VGAM RNA, and which when bound by VGAM3302 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3302 host target proteins.

[46195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3302 gene, herein designated VGAM GENE, on one or more VGAM3302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46196] It is yet further appreciated that a function of VGAM3302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3302 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM3302 correlate with, and may be deduced from, the identity of the host target genes which VGAM3302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46197] Nucleotide sequences of the VGAM3302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3302 are further described hereinbelow with reference to Table 1.

[46198] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46199] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3303 (VGAM3303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46200] VGAM3303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3303 was detected is described hereinabove with reference to Figs. 2–8.

[46201] VGAM3303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid herpesvirus 4. VGAM3303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46202] VGAM3303 gene, herein designated VGAM GENE, encodes a VGAM3303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3303 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3303 precu-

sor RNA is designated SEQ ID:74170, and is provided hereinbelow with reference to the sequence listing part.

[46203] VGAM3303 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46204] An enzyme complex designated DICER COMPLEX, dices the VGAM3303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3303 RNA is designated SEQ ID:74171, and is provided hereinbelow with reference to the se-

quence listing part.

[46205] VGAM3303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46206] VGAM3303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3303 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46207] The complementary binding of VGAM3303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3303 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46208] It is appreciated that VGAM3303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3303 host target genes. The mRNA of each one of this plurality of VGAM3303 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3303 RNA, herein designated VGAM RNA, and which when bound by VGAM3303 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3303 host target proteins.

[46209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3303 gene, herein designated VGAM GENE, on one or more VGAM3303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46210] It is yet further appreciated that a function of VGAM3303

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3303 include diagnosis, prevention and treatment of viral infection by Murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3303 correlate with, and may be deduced from, the identity of the host target genes which VGAM3303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46211] Nucleotide sequences of the VGAM3303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3303 are further described hereinbelow with reference to Table 1.

[46212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46213] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3304 (VGAM3304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46214] VGAM3304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3304 was detected is described hereinabove with reference to Figs. 2–8.

[46215] VGAM3304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid herpesvirus 4. VGAM3304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46216] VGAM3304 gene, herein designated VGAM GENE, encodes a VGAM3304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3304 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3304 precursor RNA is designated SEQ ID:74205, and is provided

hereinbelow with reference to the sequence listing part.

[46217] VGAM3304 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46218] An enzyme complex designated DICER COMPLEX, dices the VGAM3304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3304 RNA is designated SEQ ID:74206, and is provided hereinbelow with reference to the sequence listing part.

[46219] VGAM3304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46220] VGAM3304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3304 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3304 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46221] The complementary binding of VGAM3304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3304 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46222] It is appreciated that VGAM3304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3304 host target genes. The mRNA of each one of this plurality of VGAM3304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3304 RNA, herein designated VGAM RNA, and which when bound by VGAM3304 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3304 host target proteins.

[46223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3304 gene, herein designated VGAM GENE, on one or more VGAM3304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46224] It is yet further appreciated that a function of VGAM3304 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3304 include diagnosis, prevention and treatment of viral infection by Murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3304 correlate with, and may be deduced from, the identity of the host target genes which VGAM3304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46225] Nucleotide sequences of the VGAM3304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3304 are further described hereinbelow with reference to Table 1.

[46226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46227] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3305 (VGAM3305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46228] VGAM3305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3305 was detected is described hereinabove with reference to Figs. 2–8.

[46229] VGAM3305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM3305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46230] VGAM3305 gene, herein designated VGAM GENE, encodes a VGAM3305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3305 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3305 precursor RNA is designated SEQ ID:74238, and is provided hereinbelow with reference to the sequence listing part.

[46231] VGAM3305 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46232] An enzyme complex designated DICER COMPLEX, dices the VGAM3305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3305 RNA is designated SEQ ID:74239, and is provided hereinbelow with reference to the sequence listing part.

[46233] VGAM3305 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46234] VGAM3305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3305 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3305 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46235] The complementary binding of VGAM3305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3305 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46236] It is appreciated that VGAM3305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3305 host target genes. The mRNA of each one of this plurality of VGAM3305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3305 RNA, herein designated VGAM

RNA, and which when bound by VGAM3305 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3305 host target proteins.

[46237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3305 gene, herein designated VGAM GENE, on one or more VGAM3305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46238] It is yet further appreciated that a function of VGAM3305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3305 include diagnosis, prevention and treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM3305 correlate with, and may be deduced from, the identity of the host target genes which VGAM3305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46239] Nucleotide sequences of the VGAM3305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3305 are further described hereinbelow with reference to Table 1.

[46240] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46241] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3306 (VGAM3306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46242] VGAM3306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3306 was detected is described hereinabove with reference to Figs. 2-8.

[46243] VGAM3306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM3306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46244] VGAM3306 gene, herein designated VGAM GENE, encodes a VGAM3306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3306 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3306 precursor RNA is designated SEQ ID:74256, and is provided hereinbelow with reference to the sequence listing part.

[46245] VGAM3306 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46246] An enzyme complex designated DICER COMPLEX, dices the VGAM3306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3306 RNA is designated SEQ ID:74257, and is provided hereinbelow with reference to the sequence listing part.

[46247] VGAM3306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3306 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46248] VGAM3306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3306 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3306 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46249] The complementary binding of VGAM3306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3306 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46250] It is appreciated that VGAM3306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3306 host target genes. The mRNA of each one of this plurality of VGAM3306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3306 RNA, herein designated VGAM RNA, and which when bound by VGAM3306 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3306 host target proteins.

[46251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3306 gene, herein designated VGAM GENE, on one or more VGAM3306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46252] It is yet further appreciated that a function of VGAM3306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3306 include diagnosis, prevention and

treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM3306 correlate with, and may be deduced from, the identity of the host target genes which VGAM3306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46253] Nucleotide sequences of the VGAM3306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3306 are further described hereinbelow with reference to Table 1.

[46254] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46255] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3307 (VGAM3307) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46256] VGAM3307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3307 was detected is described hereinabove with reference to Figs. 2–8.

[46257] VGAM3307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46258] VGAM3307 gene, herein designated VGAM GENE, encodes a VGAM3307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3307 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3307 precursor RNA is designated SEQ ID:74286, and is provided hereinbelow with reference to the sequence listing part.

[46259] VGAM3307 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3307 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46260] An enzyme complex designated DICER COMPLEX, dices the VGAM3307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3307 RNA is designated SEQ ID:74287, and is provided hereinbelow with reference to the sequence listing part.

[46261] VGAM3307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3307 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3307 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46262] VGAM3307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3307 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3307 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3307 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46263] The complementary binding of VGAM3307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3307 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46264] It is appreciated that VGAM3307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3307 host target genes. The mRNA of each one of this plurality of VGAM3307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3307 RNA, herein designated VGAM RNA, and which when bound by VGAM3307 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3307 host target proteins.

[46265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3307 gene, herein designated VGAM GENE, on one or more VGAM3307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46266] It is yet further appreciated that a function of VGAM3307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3307 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria

Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3307 correlate with, and may be deduced from, the identity of the host target genes which VGAM3307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46267] Nucleotide sequences of the VGAM3307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3307 are further described hereinbelow with reference to Table 1.

[46268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46269] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3308 (VGAM3308) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[46270] VGAM3308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3308 was detected is described hereinabove with reference to Figs. 2–8.

[46271] VGAM3308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46272] VGAM3308 gene, herein designated VGAM GENE, encodes a VGAM3308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3308 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3308 precursor RNA is designated SEQ ID:74330, and is provided hereinbelow with reference to the sequence listing part.

[46273] VGAM3308 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3308 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46274] An enzyme complex designated DICER COMPLEX, dices the VGAM3308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3308 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3308 RNA is designated SEQ ID:74331, and is provided hereinbelow with reference to the sequence listing part.

[46275] VGAM3308 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3308 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46276] VGAM3308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3308 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46277] The complementary binding of VGAM3308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3308 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46278] It is appreciated that VGAM3308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3308 host target genes. The mRNA of each one of this plurality of VGAM3308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3308 RNA, herein designated VGAM RNA, and which when bound by VGAM3308 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3308 host target proteins.

[46279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3308 gene, herein designated VGAM GENE, on one or more VGAM3308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46280] It is yet further appreciated that a function of VGAM3308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3308 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utili-

ties, of VGAM3308 correlate with, and may be deduced from, the identity of the host target genes which VGAM3308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46281] Nucleotide sequences of the VGAM3308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3308 are further described hereinbelow with reference to Table 1.

[46282] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46283] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3309 (VGAM3309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[46284] VGAM3309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3309 was detected is described hereinabove with reference to Figs. 2–8.

[46285] VGAM3309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rous sarcoma virus. VGAM3309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46286] VGAM3309 gene, herein designated VGAM GENE, encodes a VGAM3309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3309 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3309 precursor RNA is designated SEQ ID:74349, and is provided hereinbelow with reference to the sequence listing part.

[46287] VGAM3309 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46288] An enzyme complex designated DICER COMPLEX, dices the VGAM3309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3309 RNA is designated SEQ ID:74350, and is provided hereinbelow with reference to the sequence listing part.

[46289] VGAM3309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46290] VGAM3309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3309 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46291] The complementary binding of VGAM3309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3309 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46292] It is appreciated that VGAM3309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3309 host target genes. The mRNA of each one of this plurality of VGAM3309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3309 RNA, herein designated VGAM RNA, and which when bound by VGAM3309 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3309 host target proteins.

[46293] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3309 gene, herein designated VGAM GENE, on one or more VGAM3309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46294] It is yet further appreciated that a function of VGAM3309 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3309 include diagnosis, prevention and treatment of viral infection by Rous sarcoma virus. Specific functions, and accordingly utilities, of VGAM3309 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46295] Nucleotide sequences of the VGAM3309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3309 are further described hereinbelow with reference to Table 1.

[46296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3309 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46297] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3310 (VGAM3310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46298] VGAM3310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3310 was detected is described hereinabove with reference to Figs. 2–8.

[46299] VGAM3310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46300] VGAM3310 gene, herein designated VGAM GENE, encodes a VGAM3310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3310 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3310 precursor RNA is designated SEQ ID:74360, and is provided hereinbelow with reference to the sequence listing part.

[46301] VGAM3310 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46302] An enzyme complex designated DICER COMPLEX, dices the VGAM3310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3310 RNA is designated SEQ ID:74361, and is provided hereinbelow with reference to the sequence listing part.

[46303] VGAM3310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46304] VGAM3310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3310 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46305] The complementary binding of VGAM3310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3310 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46306] It is appreciated that VGAM3310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3310 host target genes. The mRNA of each one of this plurality of VGAM3310 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3310 RNA, herein designated VGAM RNA, and which when bound by VGAM3310 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3310 host target proteins.

[46307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3310 gene, herein designated VGAM GENE, on one or more VGAM3310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46308] It is yet further appreciated that a function of VGAM3310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3310 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3310 correlate with, and may be deduced from, the identity of the host target genes which VGAM3310 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[46309] Nucleotide sequences of the VGAM3310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3310 are further described hereinbelow with reference to Table 1.

[46310] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46311] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3311 (VGAM3311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46312] VGAM3311 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3311 was detected is described hereinabove with reference to Figs. 2–8.

[46313] VGAM3311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46314] VGAM3311 gene, herein designated VGAM GENE, encodes a VGAM3311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3311 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3311 precursor RNA is designated SEQ ID:74385, and is provided hereinbelow with reference to the sequence listing part.

[46315] VGAM3311 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46316] An enzyme complex designated DICER COMPLEX, dices the VGAM3311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3311 RNA is designated SEQ ID:74386, and is provided hereinbelow with reference to the sequence listing part.

[46317] VGAM3311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46318] VGAM3311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3311 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[46319] The complementary binding of VGAM3311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3311 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46320] It is appreciated that VGAM3311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3311 host target genes. The mRNA of each one of this plurality of VGAM3311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3311 RNA, herein designated VGAM RNA, and which when bound by VGAM3311 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3311 host target proteins.

[46321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3311 gene, herein designated VGAM GENE, on one or more VGAM3311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46322] It is yet further appreciated that a function of VGAM3311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3311 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3311 correlate with, and may be deduced from, the identity of the host target genes which VGAM3311 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[46323] Nucleotide sequences of the VGAM3311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3311 are further described hereinbelow with reference to Table 1.

[46324] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46325] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3312 (VGAM3312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46326] VGAM3312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3312 was detected is described hereinabove with reference to Figs. 2–8.

[46327] VGAM3312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Red clover mottle virus. VGAM3312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46328] VGAM3312 gene, herein designated VGAM GENE, encodes a VGAM3312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3312 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3312 precursor RNA is designated SEQ ID:74440, and is provided hereinbelow with reference to the sequence listing part.

[46329] VGAM3312 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46330] An enzyme complex designated DICER COMPLEX, dices the VGAM3312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3312 RNA is designated SEQ ID:74441, and is provided hereinbelow with reference to the sequence listing part.

[46331] VGAM3312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[46332] VGAM3312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3312 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46333] The complementary binding of VGAM3312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3312 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46334] It is appreciated that VGAM3312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3312 host target genes. The mRNA of each one of this plurality of VGAM3312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3312 RNA, herein designated VGAM RNA, and which when bound by VGAM3312 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3312 host target proteins.

[46335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3312 gene, herein designated VGAM GENE, on one

or more VGAM3312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46336] It is yet further appreciated that a function of VGAM3312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3312 include diagnosis, prevention and treatment of viral infection by Red clover mottle virus. Specific functions, and accordingly utilities, of VGAM3312 correlate with, and may be deduced from, the identity of the host target genes which VGAM3312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46337] Nucleotide sequences of the VGAM3312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3312 are further described hereinbelow with reference to Table 1.

[46338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46339] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3313 (VGAM3313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46340] VGAM3313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3313 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[46341] VGAM3313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46342] VGAM3313 gene, herein designated VGAM GENE, encodes a VGAM3313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3313 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3313 precursor RNA is designated SEQ ID:74452, and is provided hereinbelow with reference to the sequence listing part.

[46343] VGAM3313 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46344] An enzyme complex designated DICER COMPLEX, dices the VGAM3313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3313 RNA is designated SEQ ID:74453, and is provided hereinbelow with reference to the sequence listing part.

[46345] VGAM3313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46346] VGAM3313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3313 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46347] The complementary binding of VGAM3313 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3313 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46348] It is appreciated that VGAM3313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3313 host target genes. The mRNA of each one of this plurality of VGAM3313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3313 RNA, herein designated VGAM RNA, and which when bound by VGAM3313 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3313 host target proteins.

[46349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3313 gene, herein designated VGAM GENE, on one or more VGAM3313 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46350] It is yet further appreciated that a function of VGAM3313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3313 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3313 correlate with, and may be deduced from, the identity of the host target genes which VGAM3313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46351] Nucleotide sequences of the VGAM3313 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3313 are further described hereinbelow with reference to Table 1.

[46352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46353] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3314 (VGAM3314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46354] VGAM3314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3314 was detected is described hereinabove with reference to Figs. 2-8.

[46355] VGAM3314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine pulmonary adenocarcinoma virus. VGAM3314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46356] VGAM3314 gene, herein designated VGAM GENE, encodes a VGAM3314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3314 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3314 precursor RNA is designated SEQ ID:74457, and is provided hereinbelow with reference to the sequence listing part.

[46357] VGAM3314 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[46358] An enzyme complex designated DICER COMPLEX, dices the VGAM3314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3314 RNA is designated SEQ ID:74458, and is provided hereinbelow with reference to the sequence listing part.

[46359] VGAM3314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46360] VGAM3314 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3314 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46361] The complementary binding of VGAM3314 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3314 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46362] It is appreciated that VGAM3314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3314 host target genes. The mRNA of each one of this plurality of VGAM3314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3314 RNA, herein designated VGAM RNA, and which when bound by VGAM3314 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3314 host target proteins.

[46363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3314 gene, herein designated VGAM GENE, on one or more VGAM3314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46364] It is yet further appreciated that a function of VGAM3314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3314 include diagnosis, prevention and treatment of viral infection by Ovine pulmonary adenocarcinoma virus. Specific functions, and accordingly utilities, of VGAM3314 correlate with, and may be deduced from, the identity of the host target genes which VGAM3314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46365] Nucleotide sequences of the VGAM3314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3314 are further described hereinbelow with reference to Table 1.

[46366] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46367] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3315 (VGAM3315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46368] VGAM3315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3315 was detected is described hereinabove with reference to Figs. 2-8.

[46369] VGAM3315 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpox virus.

VGAM3315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46370] VGAM3315 gene, herein designated VGAM GENE, encodes a VGAM3315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3315 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3315 precursor RNA is designated SEQ ID:74472, and is provided hereinbelow with reference to the sequence listing part.

[46371] VGAM3315 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46372] An enzyme complex designated DICER COMPLEX, dices the VGAM3315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3315 RNA is designated SEQ ID:74473, and is provided hereinbelow with reference to the sequence listing part.

[46373] VGAM3315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3315 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46374] VGAM3315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3315 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46375] The complementary binding of VGAM3315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3315 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3315 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46376] It is appreciated that VGAM3315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3315 host target genes. The mRNA of each one of this plurality of VGAM3315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3315 RNA, herein designated VGAM RNA, and which when bound by VGAM3315 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3315 host target proteins.

[46377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3315 gene, herein designated VGAM GENE, on one or more VGAM3315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46378] It is yet further appreciated that a function of VGAM3315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3315 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3315 correlate with, and may be deduced from, the identity of the host target genes which VGAM3315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46379] Nucleotide sequences of the VGAM3315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3315 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3315 are further described hereinbelow with reference to Table 1.

[46380] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46381] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3316 (VGAM3316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46382] VGAM3316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3316 was detected is described hereinabove with reference to Figs. 2-8.

[46383] VGAM3316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46384] VGAM3316 gene, herein designated VGAM GENE, encodes a VGAM3316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3316 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3316 precursor RNA is designated SEQ ID:74478, and is provided hereinbelow with reference to the sequence listing part.

[46385] VGAM3316 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46386] An enzyme complex designated DICER COMPLEX, dices

the VGAM3316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3316 RNA is designated SEQ ID:74479, and is provided hereinbelow with reference to the sequence listing part.

[46387] VGAM3316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3316 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46388] VGAM3316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3316 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3316 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46389] The complementary binding of VGAM3316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3316 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46390] It is appreciated that VGAM3316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3316 host target genes. The mRNA of each one of this plurality of VGAM3316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3316 RNA, herein designated VGAM RNA, and which when bound by VGAM3316 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3316 host target proteins.

[46391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3316 gene, herein designated VGAM GENE, on one or more VGAM3316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46392] It is yet further appreciated that a function of VGAM3316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3316 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3316 correlate with, and may be deduced from, the identity of the host target genes which VGAM3316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46393] Nucleotide sequences of the VGAM3316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3316 are further described hereinbelow with reference to Table 1.

[46394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46395] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3317 (VGAM3317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46396] VGAM3317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3317 was detected is described hereinabove with reference to Figs. 2-8.

[46397] VGAM3317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 86. VGAM3317 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46398] VGAM3317 gene, herein designated VGAM GENE, encodes a VGAM3317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3317 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3317 precursor RNA is designated SEQ ID:74490, and is provided hereinbelow with reference to the sequence listing part.

[46399] VGAM3317 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46400] An enzyme complex designated DICER COMPLEX, dices the VGAM3317 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3317 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3317 RNA is designated SEQ ID:74491, and is provided hereinbelow with reference to the sequence listing part.

[46401] VGAM3317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3317 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46402] VGAM3317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3317 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3317 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3317 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46403] The complementary binding of VGAM3317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3317

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46404] It is appreciated that VGAM3317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3317 host target genes. The mRNA of each one of this plurality of VGAM3317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3317 RNA, herein designated VGAM RNA, and which when bound by VGAM3317 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3317 host target proteins.

[46405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3317 gene, herein designated VGAM GENE, on one or more VGAM3317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46406] It is yet further appreciated that a function of VGAM3317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3317 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 86. Specific functions, and accordingly utilities, of VGAM3317 correlate with, and may be deduced from, the identity of the host target genes which VGAM3317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46407] Nucleotide sequences of the VGAM3317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3317 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3317 are further described hereinbelow with reference to Table 1.

[46408] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46409] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3318 (VGAM3318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46410] VGAM3318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3318 was detected is described hereinabove with reference to Figs. 2-8.

[46411] VGAM3318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek white stripe virus. VGAM3318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[46412] VGAM3318 gene, herein designated VGAM GENE, encodes a VGAM3318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3318 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3318 precursor RNA is designated SEQ ID:74526, and is provided hereinbelow with reference to the sequence listing part.

[46413] VGAM3318 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46414] An enzyme complex designated DICER COMPLEX, dices the VGAM3318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3318 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3318 RNA is designated SEQ ID:74527, and is provided hereinbelow with reference to the sequence listing part.

[46415] VGAM3318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3318 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46416] VGAM3318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3318 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46417] The complementary binding of VGAM3318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3318 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46418] It is appreciated that VGAM3318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3318 host target genes. The mRNA of each one of this plurality of VGAM3318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3318 RNA, herein designated VGAM RNA, and which when bound by VGAM3318 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3318 host target proteins.

[46419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3318 gene, herein designated VGAM GENE, on one or more VGAM3318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46420] It is yet further appreciated that a function of VGAM3318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3318 include diagnosis, prevention and treatment of viral infection by Leek white stripe virus. Specific functions, and accordingly utilities, of VGAM3318 correlate with, and may be deduced from, the identity of the host target genes which VGAM3318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46421] Nucleotide sequences of the VGAM3318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3318 are further

described hereinbelow with reference to Table 1.

[46422] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46423] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3319 (VGAM3319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46424] VGAM3319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3319 was detected is described hereinabove with reference to Figs. 2-8.

[46425] VGAM3319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Raspberry bushy dwarf virus. VGAM3319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46426] VGAM3319 gene, herein designated VGAM GENE, encodes a VGAM3319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3319 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3319 precursor RNA is designated SEQ ID:74532, and is provided hereinbelow with reference to the sequence listing part.

[46427] VGAM3319 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46428] An enzyme complex designated DICER COMPLEX, dices the VGAM3319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3319 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3319 RNA is designated SEQ ID:74533, and is provided hereinbelow with reference to the sequence listing part.

[46429] VGAM3319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46430] VGAM3319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3319 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46431] The complementary binding of VGAM3319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3319 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3319 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46432] It is appreciated that VGAM3319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3319 host target genes. The mRNA of each one of this plurality of VGAM3319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3319 RNA, herein designated VGAM RNA, and which when bound by VGAM3319 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3319 host target proteins.

[46433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3319 gene, herein designated VGAM GENE, on one or more VGAM3319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46434] It is yet further appreciated that a function of VGAM3319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3319 include diagnosis, prevention and treatment of viral infection by Raspberry bushy dwarf virus. Specific functions, and accordingly utilities, of VGAM3319 correlate with, and may be deduced from, the identity of the host target genes which VGAM3319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46435] Nucleotide sequences of the VGAM3319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3319 are further described hereinbelow with reference to Table 1.

[46436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46437] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3320 (VGAM3320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46438] VGAM3320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3320 was detected is described hereinabove with reference to Figs. 2-8.

[46439] VGAM3320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato aucuba mosaic virus. VGAM3320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46440] VGAM3320 gene, herein designated VGAM GENE, encodes

a VGAM3320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3320 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3320 precursor RNA is designated SEQ ID:74569, and is provided hereinbelow with reference to the sequence listing part.

[46441] VGAM3320 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46442] An enzyme complex designated DICER COMPLEX, dices the VGAM3320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3320 RNA is designated SEQ ID:74570, and is provided hereinbelow with reference to the sequence listing part.

[46443] VGAM3320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46444] VGAM3320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3320 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46445] The complementary binding of VGAM3320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3320 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[46446] It is appreciated that VGAM3320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3320 host target genes. The mRNA of each one of this plurality of VGAM3320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3320 RNA, herein designated VGAM RNA, and which when bound by VGAM3320 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3320 host target proteins.

[46447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3320 gene, herein designated VGAM GENE, on one or more VGAM3320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46448] It is yet further appreciated that a function of VGAM3320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3320 include diagnosis, prevention and treatment of viral infection by Potato aucuba mosaic virus. Specific functions, and accordingly utilities, of VGAM3320 correlate with, and may be deduced from, the identity of the host target genes which VGAM3320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46449] Nucleotide sequences of the VGAM3320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3320 are further described hereinbelow with reference to Table 1.

[46450] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46451] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3321 (VGAM3321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46452] VGAM3321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3321 was detected is described hereinabove with reference to Figs. 2-8.

[46453] VGAM3321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato aucuba mosaic virus. VGAM3321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46454] VGAM3321 gene, herein designated VGAM GENE, encodes a VGAM3321 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3321 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3321 precursor RNA is designated SEQ ID:74701, and is provided hereinbelow with reference to the sequence listing part.

[46455] VGAM3321 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46456] An enzyme complex designated DICER COMPLEX, dices the VGAM3321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3321 RNA is designated SEQ ID:74702, and is provided hereinbelow with reference to the sequence listing part.

[46457] VGAM3321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46458] VGAM3321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3321 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46459] The complementary binding of VGAM3321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3321 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46460] It is appreciated that VGAM3321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3321 host target genes. The mRNA of each one of this plurality of VGAM3321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3321 RNA, herein designated VGAM RNA, and which when bound by VGAM3321 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3321 host target proteins.

[46461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3321 gene, herein designated VGAM GENE, on one or more VGAM3321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46462] It is yet further appreciated that a function of VGAM3321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3321 include diagnosis, prevention and treatment of viral infection by Potato aucuba mosaic virus. Specific functions, and accordingly utilities, of VGAM3321 correlate with, and may be deduced from, the identity of the host target genes which VGAM3321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46463] Nucleotide sequences of the VGAM3321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3321 are further described hereinbelow with reference to Table 1.

[46464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46465] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3322 (VGAM3322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46466] VGAM3322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3322 was detected is described hereinabove with reference to Figs. 2-8.

[46467] VGAM3322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46468] VGAM3322 gene, herein designated VGAM GENE, encodes a VGAM3322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3322 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3322 precursor RNA is designated SEQ ID:74716, and is provided hereinbelow with reference to the sequence listing part.

[46469] VGAM3322 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46470] An enzyme complex designated DICER COMPLEX, dices the VGAM3322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3322 RNA is designated SEQ ID:74717, and is provided hereinbelow with reference to the sequence listing part.

[46471] VGAM3322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46472] VGAM3322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3322 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46473] The complementary binding of VGAM3322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3322 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46474] It is appreciated that VGAM3322 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3322 host target genes. The mRNA of each one of this plurality of VGAM3322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3322 RNA, herein designated VGAM RNA, and which when bound by VGAM3322 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3322 host target proteins.

[46475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3322 gene, herein designated VGAM GENE, on one or more VGAM3322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46476] It is yet further appreciated that a function of VGAM3322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3322 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3322 correlate with, and may be deduced from, the identity of the host target genes which VGAM3322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46477] Nucleotide sequences of the VGAM3322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3322 are further described hereinbelow with reference to Table 1.

[46478] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46479] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3323 (VGAM3323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46480] VGAM3323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3323 was detected is described hereinabove with reference to Figs. 2–8.

[46481] VGAM3323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 2. VGAM3323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46482] VGAM3323 gene, herein designated VGAM GENE, encodes a VGAM3323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3323 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3323 precursor RNA is designated SEQ ID:74719, and is provided hereinbelow with reference to the sequence listing part.

[46483] VGAM3323 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46484] An enzyme complex designated DICER COMPLEX, dices the VGAM3323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3323 RNA is designated SEQ ID:74720, and is provided hereinbelow with reference to the sequence listing part.

[46485] VGAM3323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46486] VGAM3323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3323 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46487] The complementary binding of VGAM3323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3323 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46488] It is appreciated that VGAM3323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3323 host target genes. The mRNA of each one of this plurality of VGAM3323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3323 RNA, herein designated VGAM RNA, and which when bound by VGAM3323 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3323 host target proteins.

[46489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3323 gene, herein designated VGAM GENE, on one or more VGAM3323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[46490] It is yet further appreciated that a function of VGAM3323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3323 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 2. Specific functions, and accordingly utilities, of VGAM3323 correlate with, and may be deduced from, the identity of the host target genes which VGAM3323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46491] Nucleotide sequences of the VGAM3323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3323 are further described hereinbelow with reference to Table 1.

[46492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46493] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3324 (VGAM3324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46494] VGAM3324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3324 was detected is described hereinabove with reference to Figs. 2–8.

[46495] VGAM3324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human parainfluenza virus 2. VGAM3324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46496] VGAM3324 gene, herein designated VGAM GENE, encodes a VGAM3324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3324 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3324 precursor RNA is designated SEQ ID:74733, and is provided hereinbelow with reference to the sequence listing part.

[46497] VGAM3324 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46498] An enzyme complex designated DICER COMPLEX, dices the VGAM3324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3324 RNA is designated SEQ ID:74734, and is provided hereinbelow with reference to the sequence listing part.

[46499] VGAM3324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46500] VGAM3324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3324 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46501] The complementary binding of VGAM3324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3324 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46502] It is appreciated that VGAM3324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3324 host target genes. The mRNA of

each one of this plurality of VGAM3324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3324 RNA, herein designated VGAM RNA, and which when bound by VGAM3324 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3324 host target proteins.

[46503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3324 gene, herein designated VGAM GENE, on one or more VGAM3324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[46504] It is yet further appreciated that a function of VGAM3324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3324 include diagnosis, prevention and treatment of viral infection by Human parainfluenza virus 2. Specific functions, and accordingly utilities, of VGAM3324 correlate with, and may be deduced from, the identity of the host target genes which VGAM3324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46505] Nucleotide sequences of the VGAM3324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3324 are further described hereinbelow with reference to Table 1.

[46506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3324 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[46507] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3325 (VGAM3325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46508] VGAM3325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3325 was detected is described hereinabove with reference to Figs. 2–8.

[46509] VGAM3325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM3325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46510] VGAM3325 gene, herein designated VGAM GENE, encodes a VGAM3325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3325 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3325 precursor RNA is designated SEQ ID:74740, and is provided hereinbelow with reference to the sequence listing part.

[46511] VGAM3325 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46512] An enzyme complex designated DICER COMPLEX, dices the VGAM3325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3325 RNA is designated SEQ ID:74741,

and is provided hereinbelow with reference to the sequence listing part.

[46513] VGAM3325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46514] VGAM3325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3325 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46515] The complementary binding of VGAM3325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3325 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46516] It is appreciated that VGAM3325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3325 host target genes. The mRNA of each one of this plurality of VGAM3325 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3325 RNA, herein designated VGAM RNA, and which when bound by VGAM3325 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3325 host target proteins.

[46517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3325 gene, herein designated VGAM GENE, on one or more VGAM3325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46518] It is yet further appreciated that a function of VGAM3325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3325 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM3325 correlate with, and may be deduced from, the identity of the host target genes which VGAM3325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46519] Nucleotide sequences of the VGAM3325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3325 are further described hereinbelow with reference to Table 1.

[46520] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46521] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3326 (VGAM3326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46522] VGAM3326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3326 was detected is described hereinabove with reference to Figs. 2–8.

[46523] VGAM3326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM3326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46524] VGAM3326 gene, herein designated VGAM GENE, encodes a VGAM3326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3326 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3326 precu-

sor RNA is designated SEQ ID:74764, and is provided hereinbelow with reference to the sequence listing part.

[46525] VGAM3326 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46526] An enzyme complex designated DICER COMPLEX, dices the VGAM3326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3326 RNA is designated SEQ ID:74765, and is provided hereinbelow with reference to the se-

quence listing part.

[46527] VGAM3326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46528] VGAM3326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3326 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46529] The complementary binding of VGAM3326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3326 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46530] It is appreciated that VGAM3326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3326 host target genes. The mRNA of each one of this plurality of VGAM3326 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3326 RNA, herein designated VGAM RNA, and which when bound by VGAM3326 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3326 host target proteins.

[46531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3326 gene, herein designated VGAM GENE, on one or more VGAM3326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46532] It is yet further appreciated that a function of VGAM3326

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3326 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM3326 correlate with, and may be deduced from, the identity of the host target genes which VGAM3326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46533] Nucleotide sequences of the VGAM3326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3326 are further described hereinbelow with reference to Table 1.

[46534] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46535] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3327 (VGAM3327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46536] VGAM3327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3327 was detected is described hereinabove with reference to Figs. 2–8.

[46537] VGAM3327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus. VGAM3327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46538] VGAM3327 gene, herein designated VGAM GENE, encodes a VGAM3327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3327 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3327 precursor RNA is designated SEQ ID:74768, and is provided

hereinbelow with reference to the sequence listing part.

[46539] VGAM3327 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46540] An enzyme complex designated DICER COMPLEX, dices the VGAM3327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3327 RNA is designated SEQ ID:74769, and is provided hereinbelow with reference to the sequence listing part.

[46541] VGAM3327 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46542] VGAM3327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3327 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3327 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46543] The complementary binding of VGAM3327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3327 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46544] It is appreciated that VGAM3327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3327 host target genes. The mRNA of each one of this plurality of VGAM3327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3327 RNA, herein designated VGAM RNA, and which when bound by VGAM3327 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3327 host target proteins.

[46545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3327 gene, herein designated VGAM GENE, on one or more VGAM3327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46546] It is yet further appreciated that a function of VGAM3327 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3327 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus.

Specific functions, and accordingly utilities, of VGAM3327 correlate with, and may be deduced from, the identity of the host target genes which VGAM3327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46547] Nucleotide sequences of the VGAM3327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3327 are further described hereinbelow with reference to Table 1.

[46548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46549] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3328 (VGAM3328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46550] VGAM3328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3328 was detected is described hereinabove with reference to Figs. 2–8.

[46551] VGAM3328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine oral papillomavirus. VGAM3328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46552] VGAM3328 gene, herein designated VGAM GENE, encodes a VGAM3328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3328 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3328 precursor RNA is designated SEQ ID:74779, and is provided hereinbelow with reference to the sequence listing part.

[46553] VGAM3328 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46554] An enzyme complex designated DICER COMPLEX, dices the VGAM3328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3328 RNA is designated SEQ ID:74780, and is provided hereinbelow with reference to the sequence listing part.

[46555] VGAM3328 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46556] VGAM3328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3328 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3328 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46557] The complementary binding of VGAM3328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3328 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46558] It is appreciated that VGAM3328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3328 host target genes. The mRNA of each one of this plurality of VGAM3328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3328 RNA, herein designated VGAM

RNA, and which when bound by VGAM3328 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3328 host target proteins.

[46559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3328 gene, herein designated VGAM GENE, on one or more VGAM3328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46560] It is yet further appreciated that a function of VGAM3328 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3328 include diagnosis, prevention and treatment of viral infection by Canine oral papillomavirus. Specific functions, and accordingly utilities, of VGAM3328 correlate with, and may be deduced from, the identity of the host target genes which VGAM3328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46561] Nucleotide sequences of the VGAM3328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3328 are further described hereinbelow with reference to Table 1.

[46562] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46563] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3329 (VGAM3329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46564] VGAM3329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3329 was detected is described hereinabove with reference to Figs. 2-8.

[46565] VGAM3329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM3329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46566] VGAM3329 gene, herein designated VGAM GENE, encodes a VGAM3329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3329 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3329 precursor RNA is designated SEQ ID:74799, and is provided hereinbelow with reference to the sequence listing part.

[46567] VGAM3329 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46568] An enzyme complex designated DICER COMPLEX, dices the VGAM3329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3329 RNA is designated SEQ ID:74800, and is provided hereinbelow with reference to the sequence listing part.

[46569] VGAM3329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3329 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46570] VGAM3329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3329 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3329 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46571] The complementary binding of VGAM3329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3329 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46572] It is appreciated that VGAM3329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3329 host target genes. The mRNA of each one of this plurality of VGAM3329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3329 RNA, herein designated VGAM RNA, and which when bound by VGAM3329 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3329 host target proteins.

[46573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3329 gene, herein designated VGAM GENE, on one or more VGAM3329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46574] It is yet further appreciated that a function of VGAM3329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3329 include diagnosis, prevention and

treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3329 correlate with, and may be deduced from, the identity of the host target genes which VGAM3329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46575] Nucleotide sequences of the VGAM3329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3329 are further described hereinbelow with reference to Table 1.

[46576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46577] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3330 (VGAM3330) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46578] VGAM3330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3330 was detected is described hereinabove with reference to Figs. 2–8.

[46579] VGAM3330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46580] VGAM3330 gene, herein designated VGAM GENE, encodes a VGAM3330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3330 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3330 precursor RNA is designated SEQ ID:74805, and is provided hereinbelow with reference to the sequence listing part.

[46581] VGAM3330 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3330 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46582] An enzyme complex designated DICER COMPLEX, dices the VGAM3330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3330 RNA is designated SEQ ID:74806, and is provided hereinbelow with reference to the sequence listing part.

[46583] VGAM3330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3330 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3330 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46584] VGAM3330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3330 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3330 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46585] The complementary binding of VGAM3330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3330 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46586] It is appreciated that VGAM3330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3330 host target genes. The mRNA of each one of this plurality of VGAM3330 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3330 RNA, herein designated VGAM RNA, and which when bound by VGAM3330 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3330 host target proteins.

[46587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3330 gene, herein designated VGAM GENE, on one or more VGAM3330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46588] It is yet further appreciated that a function of VGAM3330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3330 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Spe-

cific functions, and accordingly utilities, of VGAM3330 correlate with, and may be deduced from, the identity of the host target genes which VGAM3330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46589] Nucleotide sequences of the VGAM3330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3330 are further described hereinbelow with reference to Table 1.

[46590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46591] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3331 (VGAM3331) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[46592] VGAM3331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3331 was detected is described hereinabove with reference to Figs. 2–8.

[46593] VGAM3331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46594] VGAM3331 gene, herein designated VGAM GENE, encodes a VGAM3331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3331 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3331 precursor RNA is designated SEQ ID:74817, and is provided hereinbelow with reference to the sequence listing part.

[46595] VGAM3331 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3331 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46596] An enzyme complex designated DICER COMPLEX, dices the VGAM3331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3331 RNA is designated SEQ ID:74818, and is provided hereinbelow with reference to the sequence listing part.

[46597] VGAM3331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3331 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46598] VGAM3331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3331 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46599] The complementary binding of VGAM3331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3331 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46600] It is appreciated that VGAM3331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3331 host target genes. The mRNA of each one of this plurality of VGAM3331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3331 RNA, herein designated VGAM RNA, and which when bound by VGAM3331 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3331 host target proteins.

[46601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3331 gene, herein designated VGAM GENE, on one or more VGAM3331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46602] It is yet further appreciated that a function of VGAM3331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3331 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM3331

correlate with, and may be deduced from, the identity of the host target genes which VGAM3331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46603] Nucleotide sequences of the VGAM3331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3331 are further described hereinbelow with reference to Table 1.

[46604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46605] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3332 (VGAM3332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[46606] VGAM3332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3332 was detected is described hereinabove with reference to Figs. 2–8.

[46607] VGAM3332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46608] VGAM3332 gene, herein designated VGAM GENE, encodes a VGAM3332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3332 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3332 precursor RNA is designated SEQ ID:74900, and is provided hereinbelow with reference to the sequence listing part.

[46609] VGAM3332 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46610] An enzyme complex designated DICER COMPLEX, dices the VGAM3332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3332 RNA is designated SEQ ID:74901, and is provided hereinbelow with reference to the sequence listing part.

[46611] VGAM3332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46612] VGAM3332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3332 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46613] The complementary binding of VGAM3332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3332 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46614] It is appreciated that VGAM3332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3332 host target genes. The mRNA of each one of this plurality of VGAM3332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3332 RNA, herein designated VGAM RNA, and which when bound by VGAM3332 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3332 host target proteins.

[46615] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3332 gene, herein designated VGAM GENE, on one or more VGAM3332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46616] It is yet further appreciated that a function of VGAM3332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3332 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3332 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46617] Nucleotide sequences of the VGAM3332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3332 are further described hereinbelow with reference to Table 1.

[46618] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46619] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3333 (VGAM3333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46620] VGAM3333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3333 was detected is described hereinabove with reference to Figs. 2–8.

[46621] VGAM3333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Soybean mosaic virus. VGAM3333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46622] VGAM3333 gene, herein designated VGAM GENE, encodes a VGAM3333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3333 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3333 precursor RNA is designated SEQ ID:74933, and is provided hereinbelow with reference to the sequence listing part.

[46623] VGAM3333 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46624] An enzyme complex designated DICER COMPLEX, dices the VGAM3333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3333 RNA is designated SEQ ID:74934, and is provided hereinbelow with reference to the sequence listing part.

[46625] VGAM3333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46626] VGAM3333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3333 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46627] The complementary binding of VGAM3333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3333 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46628] It is appreciated that VGAM3333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3333 host target genes. The mRNA of each one of this plurality of VGAM3333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3333 RNA, herein designated VGAM RNA, and which when bound by VGAM3333 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3333 host target proteins.

[46629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3333 gene, herein designated VGAM GENE, on one or more VGAM3333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46630] It is yet further appreciated that a function of VGAM3333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3333 include diagnosis, prevention and treatment of viral infection by Soybean mosaic virus. Specific functions, and accordingly utilities, of VGAM3333 correlate with, and may be deduced from, the identity of the host target genes which VGAM3333 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[46631] Nucleotide sequences of the VGAM3333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3333 are further described hereinbelow with reference to Table 1.

[46632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46633] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3334 (VGAM3334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46634] VGAM3334 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3334 was detected is described hereinabove with reference to Figs. 2–8.

[46635] VGAM3334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco rattle virus. VGAM3334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46636] VGAM3334 gene, herein designated VGAM GENE, encodes a VGAM3334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3334 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3334 precursor RNA is designated SEQ ID:74942, and is provided hereinbelow with reference to the sequence listing part.

[46637] VGAM3334 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46638] An enzyme complex designated DICER COMPLEX, dices the VGAM3334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3334 RNA is designated SEQ ID:74943, and is provided hereinbelow with reference to the sequence listing part.

[46639] VGAM3334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46640] VGAM3334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3334 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[46641] The complementary binding of VGAM3334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3334 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46642] It is appreciated that VGAM3334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3334 host target genes. The mRNA of each one of this plurality of VGAM3334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3334 RNA, herein designated VGAM RNA, and which when bound by VGAM3334 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3334 host target proteins.

[46643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3334 gene, herein designated VGAM GENE, on one or more VGAM3334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46644] It is yet further appreciated that a function of VGAM3334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3334 include diagnosis, prevention and treatment of viral infection by Tobacco rattle virus. Specific functions, and accordingly utilities, of VGAM3334 correlate with, and may be deduced from, the identity of the host target genes which VGAM3334 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[46645] Nucleotide sequences of the VGAM3334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3334 are further described hereinbelow with reference to Table 1.

[46646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46647] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3335 (VGAM3335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46648] VGAM3335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3335 was detected is described hereinabove with reference to Figs. 2–8.

[46649] VGAM3335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco rattle virus.

VGAM3335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46650] VGAM3335 gene, herein designated VGAM GENE, encodes a VGAM3335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3335 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3335 precursor RNA is designated SEQ ID:74947, and is provided hereinbelow with reference to the sequence listing part.

[46651] VGAM3335 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46652] An enzyme complex designated DICER COMPLEX, dices the VGAM3335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3335 RNA is designated SEQ ID:74948, and is provided hereinbelow with reference to the sequence listing part.

[46653] VGAM3335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[46654] VGAM3335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3335 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46655] The complementary binding of VGAM3335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3335 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46656] It is appreciated that VGAM3335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3335 host target genes. The mRNA of each one of this plurality of VGAM3335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3335 RNA, herein designated VGAM RNA, and which when bound by VGAM3335 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3335 host target proteins.

[46657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3335 gene, herein designated VGAM GENE, on one

or more VGAM3335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46658] It is yet further appreciated that a function of VGAM3335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3335 include diagnosis, prevention and treatment of viral infection by Tobacco rattle virus. Specific functions, and accordingly utilities, of VGAM3335 correlate with, and may be deduced from, the identity of the host target genes which VGAM3335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46659] Nucleotide sequences of the VGAM3335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3335 are further described hereinbelow with reference to Table 1.

[46660] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46661] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3336 (VGAM3336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46662] VGAM3336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3336 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[46663] VGAM3336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Melanoplus sanguinipes* entomopoxvirus. VGAM3336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46664] VGAM3336 gene, herein designated VGAM GENE, encodes a VGAM3336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3336 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3336 precursor RNA is designated SEQ ID:74960, and is provided hereinbelow with reference to the sequence listing part.

[46665] VGAM3336 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46666] An enzyme complex designated DICER COMPLEX, dices the VGAM3336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3336 RNA is designated SEQ ID:74961, and is provided hereinbelow with reference to the sequence listing part.

[46667] VGAM3336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46668] VGAM3336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3336 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46669] The complementary binding of VGAM3336 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3336 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46670] It is appreciated that VGAM3336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3336 host target genes. The mRNA of each one of this plurality of VGAM3336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3336 RNA, herein designated VGAM RNA, and which when bound by VGAM3336 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3336 host target proteins.

[46671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3336 gene, herein designated VGAM GENE, on one or more VGAM3336 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46672] It is yet further appreciated that a function of VGAM3336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3336 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3336 correlate with, and may be deduced from, the identity of the host target genes which VGAM3336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46673] Nucleotide sequences of the VGAM3336 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3336 are further described hereinbelow with reference to Table 1.

[46674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46675] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3337 (VGAM3337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46676] VGAM3337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3337 was detected is described hereinabove with reference to Figs. 2-8.

[46677] VGAM3337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM3337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46678] VGAM3337 gene, herein designated VGAM GENE, encodes a VGAM3337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3337 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3337 precursor RNA is designated SEQ ID:74963, and is provided hereinbelow with reference to the sequence listing part.

[46679] VGAM3337 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[46680] An enzyme complex designated DICER COMPLEX, dices the VGAM3337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3337 RNA is designated SEQ ID:74964, and is provided hereinbelow with reference to the sequence listing part.

[46681] VGAM3337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46682] VGAM3337 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3337 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46683] The complementary binding of VGAM3337 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3337 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46684] It is appreciated that VGAM3337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3337 host target genes. The mRNA of each one of this plurality of VGAM3337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3337 RNA, herein designated VGAM RNA, and which when bound by VGAM3337 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3337 host target proteins.

[46685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3337 gene, herein designated VGAM GENE, on one or more VGAM3337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46686] It is yet further appreciated that a function of VGAM3337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3337 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM3337 correlate with, and may be deduced from, the identity of the host target genes which VGAM3337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46687] Nucleotide sequences of the VGAM3337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3337 are further described hereinbelow with reference to Table 1.

[46688] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46689] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3338 (VGAM3338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46690] VGAM3338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3338 was detected is described hereinabove with reference to Figs. 2-8.

[46691] VGAM3338 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian paramyxovirus 6. VGAM3338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46692] VGAM3338 gene, herein designated VGAM GENE, encodes a VGAM3338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3338 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3338 precursor RNA is designated SEQ ID:75002, and is provided hereinbelow with reference to the sequence listing part.

[46693] VGAM3338 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46694] An enzyme complex designated DICER COMPLEX, dices the VGAM3338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3338 RNA is designated SEQ ID:75003, and is provided hereinbelow with reference to the sequence listing part.

[46695] VGAM3338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3338 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46696] VGAM3338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3338 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46697] The complementary binding of VGAM3338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3338 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3338 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46698] It is appreciated that VGAM3338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3338 host target genes. The mRNA of each one of this plurality of VGAM3338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3338 RNA, herein designated VGAM RNA, and which when bound by VGAM3338 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3338 host target proteins.

[46699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3338 gene, herein designated VGAM GENE, on one or more VGAM3338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46700] It is yet further appreciated that a function of VGAM3338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3338 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM3338 correlate with, and may be deduced from, the identity of the host target genes which VGAM3338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46701] Nucleotide sequences of the VGAM3338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3338 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3338 are further described hereinbelow with reference to Table 1.

[46702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46703] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3339 (VGAM3339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46704] VGAM3339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3339 was detected is described hereinabove with reference to Figs. 2-8.

[46705] VGAM3339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cy-

tomegalovirus. VGAM3339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46706] VGAM3339 gene, herein designated VGAM GENE, encodes a VGAM3339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3339 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3339 precursor RNA is designated SEQ ID:75014, and is provided hereinbelow with reference to the sequence listing part.

[46707] VGAM3339 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46708] An enzyme complex designated DICER COMPLEX, dices

the VGAM3339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3339 RNA is designated SEQ ID:75015, and is provided hereinbelow with reference to the sequence listing part.

[46709] VGAM3339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3339 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46710] VGAM3339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3339 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3339 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46711] The complementary binding of VGAM3339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3339 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46712] It is appreciated that VGAM3339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3339 host target genes. The mRNA of each one of this plurality of VGAM3339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3339 RNA, herein designated VGAM RNA, and which when bound by VGAM3339 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3339 host target proteins.

[46713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3339 gene, herein designated VGAM GENE, on one or more VGAM3339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46714] It is yet further appreciated that a function of VGAM3339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3339 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3339 correlate with, and may be deduced from, the identity of the host target genes which VGAM3339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46715] Nucleotide sequences of the VGAM3339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3339 are further described hereinbelow with reference to Table 1.

[46716] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46717] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3340 (VGAM3340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46718] VGAM3340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3340 was detected is described hereinabove with reference to Figs. 2-8.

[46719] VGAM3340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea severe mosaic virus. VGAM3340 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46720] VGAM3340 gene, herein designated VGAM GENE, encodes a VGAM3340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3340 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3340 precursor RNA is designated SEQ ID:75024, and is provided hereinbelow with reference to the sequence listing part.

[46721] VGAM3340 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46722] An enzyme complex designated DICER COMPLEX, dices the VGAM3340 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3340 RNA is designated SEQ ID:75025, and is provided hereinbelow with reference to the sequence listing part.

[46723] VGAM3340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3340 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46724] VGAM3340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3340 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3340 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46725] The complementary binding of VGAM3340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3340

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46726] It is appreciated that VGAM3340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3340 host target genes. The mRNA of each one of this plurality of VGAM3340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3340 RNA, herein designated VGAM RNA, and which when bound by VGAM3340 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3340 host target proteins.

[46727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3340 gene, herein designated VGAM GENE, on one or more VGAM3340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46728] It is yet further appreciated that a function of VGAM3340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3340 include diagnosis, prevention and treatment of viral infection by Cowpea severe mosaic virus. Specific functions, and accordingly utilities, of VGAM3340 correlate with, and may be deduced from, the identity of the host target genes which VGAM3340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46729] Nucleotide sequences of the VGAM3340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3340 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3340 are further described hereinbelow with reference to Table 1.

[46730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46731] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3341 (VGAM3341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46732] VGAM3341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3341 was detected is described hereinabove with reference to Figs. 2-8.

[46733] VGAM3341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[46734] VGAM3341 gene, herein designated VGAM GENE, encodes a VGAM3341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3341 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3341 precursor RNA is designated SEQ ID:75074, and is provided hereinbelow with reference to the sequence listing part.

[46735] VGAM3341 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46736] An enzyme complex designated DICER COMPLEX, dices the VGAM3341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3341 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3341 RNA is designated SEQ ID:75075, and is provided hereinbelow with reference to the sequence listing part.

[46737] VGAM3341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3341 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46738] VGAM3341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3341 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46739] The complementary binding of VGAM3341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3341 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46740] It is appreciated that VGAM3341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3341 host target genes. The mRNA of each one of this plurality of VGAM3341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3341 RNA, herein designated VGAM RNA, and which when bound by VGAM3341 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3341 host target proteins.

[46741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3341 gene, herein designated VGAM GENE, on one or more VGAM3341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46742] It is yet further appreciated that a function of VGAM3341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3341 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3341 correlate with, and may be deduced from, the identity of the host target genes which VGAM3341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46743] Nucleotide sequences of the VGAM3341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3341 are further

described hereinbelow with reference to Table 1.

[46744] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46745] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3342 (VGAM3342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46746] VGAM3342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3342 was detected is described hereinabove with reference to Figs. 2-8.

[46747] VGAM3342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 48. VGAM3342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46748] VGAM3342 gene, herein designated VGAM GENE, encodes a VGAM3342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3342 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3342 precursor RNA is designated SEQ ID:75210, and is provided hereinbelow with reference to the sequence listing part.

[46749] VGAM3342 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46750] An enzyme complex designated DICER COMPLEX, dices the VGAM3342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3342 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3342 RNA is designated SEQ ID:75211, and is provided hereinbelow with reference to the sequence listing part.

[46751] VGAM3342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46752] VGAM3342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3342 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46753] The complementary binding of VGAM3342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3342 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3342 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46754] It is appreciated that VGAM3342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3342 host target genes. The mRNA of each one of this plurality of VGAM3342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3342 RNA, herein designated VGAM RNA, and which when bound by VGAM3342 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3342 host target proteins.

[46755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3342 gene, herein designated VGAM GENE, on one or more VGAM3342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46756] It is yet further appreciated that a function of VGAM3342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3342 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 48. Specific functions, and accordingly utilities, of VGAM3342 correlate with, and may be deduced from, the identity of the host target genes which VGAM3342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46757] Nucleotide sequences of the VGAM3342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3342 are further described hereinbelow with reference to Table 1.

[46758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46759] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3343 (VGAM3343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46760] VGAM3343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3343 was detected is described hereinabove with reference to Figs. 2-8.

[46761] VGAM3343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM3343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46762] VGAM3343 gene, herein designated VGAM GENE, encodes

a VGAM3343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3343 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3343 precursor RNA is designated SEQ ID:75233, and is provided hereinbelow with reference to the sequence listing part.

[46763] VGAM3343 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46764] An enzyme complex designated DICER COMPLEX, dices the VGAM3343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3343 RNA is designated SEQ ID:75234, and is provided hereinbelow with reference to the sequence listing part.

[46765] VGAM3343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46766] VGAM3343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3343 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46767] The complementary binding of VGAM3343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3343 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[46768] It is appreciated that VGAM3343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3343 host target genes. The mRNA of each one of this plurality of VGAM3343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3343 RNA, herein designated VGAM RNA, and which when bound by VGAM3343 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3343 host target proteins.

[46769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3343 gene, herein designated VGAM GENE, on one or more VGAM3343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46770] It is yet further appreciated that a function of VGAM3343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3343 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM3343 correlate with, and may be deduced from, the identity of the host target genes which VGAM3343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46771] Nucleotide sequences of the VGAM3343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3343 are further described hereinbelow with reference to Table 1.

[46772] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46773] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3344 (VGAM3344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46774] VGAM3344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3344 was detected is described hereinabove with reference to Figs. 2-8.

[46775] VGAM3344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM3344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46776] VGAM3344 gene, herein designated VGAM GENE, encodes a VGAM3344 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3344 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3344 precursor RNA is designated SEQ ID:75248, and is provided hereinbelow with reference to the sequence listing part.

[46777] VGAM3344 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46778] An enzyme complex designated DICER COMPLEX, dices the VGAM3344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3344 RNA is designated SEQ ID:75249, and is provided hereinbelow with reference to the sequence listing part.

[46779] VGAM3344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46780] VGAM3344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3344 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46781] The complementary binding of VGAM3344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3344 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46782] It is appreciated that VGAM3344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3344 host target genes. The mRNA of each one of this plurality of VGAM3344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3344 RNA, herein designated VGAM RNA, and which when bound by VGAM3344 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3344 host target proteins.

[46783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3344 gene, herein designated VGAM GENE, on one or more VGAM3344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46784] It is yet further appreciated that a function of VGAM3344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3344 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM3344 correlate with, and may be deduced from, the identity of the host target genes which VGAM3344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46785] Nucleotide sequences of the VGAM3344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3344 are further described hereinbelow with reference to Table 1.

[46786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46787] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3345 (VGAM3345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46788] VGAM3345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3345 was detected is described hereinabove with reference to Figs. 2-8.

[46789] VGAM3345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 60. VGAM3345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46790] VGAM3345 gene, herein designated VGAM GENE, encodes a VGAM3345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3345 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3345 precursor RNA is designated SEQ ID:75258, and is provided hereinbelow with reference to the sequence listing part.

[46791] VGAM3345 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46792] An enzyme complex designated DICER COMPLEX, dices the VGAM3345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3345 RNA is designated SEQ ID:75259, and is provided hereinbelow with reference to the sequence listing part.

[46793] VGAM3345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46794] VGAM3345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3345 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46795] The complementary binding of VGAM3345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3345 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46796] It is appreciated that VGAM3345 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3345 host target genes. The mRNA of each one of this plurality of VGAM3345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3345 RNA, herein designated VGAM RNA, and which when bound by VGAM3345 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3345 host target proteins.

[46797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3345 gene, herein designated VGAM GENE, on one or more VGAM3345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46798] It is yet further appreciated that a function of VGAM3345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3345 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 60. Specific functions, and accordingly utilities, of VGAM3345 correlate with, and may be deduced from, the identity of the host target genes which VGAM3345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46799] Nucleotide sequences of the VGAM3345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3345 are further described hereinbelow with reference to Table 1.

[46800] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46801] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3346 (VGAM3346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46802] VGAM3346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3346 was detected is described hereinabove with reference to Figs. 2–8.

[46803] VGAM3346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 60. VGAM3346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46804] VGAM3346 gene, herein designated VGAM GENE, encodes a VGAM3346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3346 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3346 precursor RNA is designated SEQ ID:75273, and is provided hereinbelow with reference to the sequence listing part.

[46805] VGAM3346 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46806] An enzyme complex designated DICER COMPLEX, dices the VGAM3346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3346 RNA is designated SEQ ID:75274, and is provided hereinbelow with reference to the sequence listing part.

[46807] VGAM3346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46808] VGAM3346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3346 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46809] The complementary binding of VGAM3346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3346 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46810] It is appreciated that VGAM3346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3346 host target genes. The mRNA of each one of this plurality of VGAM3346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3346 RNA, herein designated VGAM RNA, and which when bound by VGAM3346 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3346 host target proteins.

[46811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3346 gene, herein designated VGAM GENE, on one or more VGAM3346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[46812] It is yet further appreciated that a function of VGAM3346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3346 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 60. Specific functions, and accordingly utilities, of VGAM3346 correlate with, and may be deduced from, the identity of the host target genes which VGAM3346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46813] Nucleotide sequences of the VGAM3346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3346 are further described hereinbelow with reference to Table 1.

[46814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46815] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3347 (VGAM3347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46816] VGAM3347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3347 was detected is described hereinabove with reference to Figs. 2-8.

[46817] VGAM3347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46818] VGAM3347 gene, herein designated VGAM GENE, encodes a VGAM3347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3347 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3347 precursor RNA is designated SEQ ID:75286, and is provided hereinbelow with reference to the sequence listing part.

[46819] VGAM3347 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46820] An enzyme complex designated DICER COMPLEX, dices the VGAM3347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3347 RNA is designated SEQ ID:75287, and is provided hereinbelow with reference to the sequence listing part.

[46821] VGAM3347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46822] VGAM3347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3347 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46823] The complementary binding of VGAM3347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3347 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46824] It is appreciated that VGAM3347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3347 host target genes. The mRNA of

each one of this plurality of VGAM3347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3347 RNA, herein designated VGAM RNA, and which when bound by VGAM3347 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3347 host target proteins.

[46825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3347 gene, herein designated VGAM GENE, on one or more VGAM3347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[46826] It is yet further appreciated that a function of VGAM3347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3347 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3347 correlate with, and may be deduced from, the identity of the host target genes which VGAM3347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46827] Nucleotide sequences of the VGAM3347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3347 are further described hereinbelow with reference to Table 1.

[46828] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3347 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[46829] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3348 (VGAM3348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46830] VGAM3348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3348 was detected is described hereinabove with reference to Figs. 2–8.

[46831] VGAM3348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea mottle virus. VGAM3348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46832] VGAM3348 gene, herein designated VGAM GENE, encodes a VGAM3348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3348 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3348 precursor RNA is designated SEQ ID:75309, and is provided hereinbelow with reference to the sequence listing part.

[46833] VGAM3348 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46834] An enzyme complex designated DICER COMPLEX, dices the VGAM3348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3348 RNA is designated SEQ ID:75310,

and is provided hereinbelow with reference to the sequence listing part.

[46835] VGAM3348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46836] VGAM3348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3348 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46837] The complementary binding of VGAM3348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3348 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46838] It is appreciated that VGAM3348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3348 host target genes. The mRNA of each one of this plurality of VGAM3348 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3348 RNA, herein designated VGAM RNA, and which when bound by VGAM3348 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3348 host target proteins.

[46839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3348 gene, herein designated VGAM GENE, on one or more VGAM3348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46840] It is yet further appreciated that a function of VGAM3348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3348 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM3348 correlate with, and may be deduced from, the identity of the host target genes which VGAM3348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46841] Nucleotide sequences of the VGAM3348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3348 are further described hereinbelow with reference to Table 1.

[46842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46843] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3349 (VGAM3349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46844] VGAM3349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3349 was detected is described hereinabove with reference to Figs. 2–8.

[46845] VGAM3349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46846] VGAM3349 gene, herein designated VGAM GENE, encodes a VGAM3349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3349 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3349 precu-

sor RNA is designated SEQ ID:75326, and is provided hereinbelow with reference to the sequence listing part.

[46847] VGAM3349 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46848] An enzyme complex designated DICER COMPLEX, dices the VGAM3349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3349 RNA is designated SEQ ID:75327, and is provided hereinbelow with reference to the se-

quence listing part.

[46849] VGAM3349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46850] VGAM3349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3349 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46851] The complementary binding of VGAM3349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3349 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46852] It is appreciated that VGAM3349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3349 host target genes. The mRNA of each one of this plurality of VGAM3349 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3349 RNA, herein designated VGAM RNA, and which when bound by VGAM3349 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3349 host target proteins.

[46853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3349 gene, herein designated VGAM GENE, on one or more VGAM3349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46854] It is yet further appreciated that a function of VGAM3349

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3349 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3349 correlate with, and may be deduced from, the identity of the host target genes which VGAM3349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46855] Nucleotide sequences of the VGAM3349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3349 are further described hereinbelow with reference to Table 1.

[46856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46857] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3350 (VGAM3350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46858] VGAM3350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3350 was detected is described hereinabove with reference to Figs. 2–8.

[46859] VGAM3350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM3350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46860] VGAM3350 gene, herein designated VGAM GENE, encodes a VGAM3350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3350 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3350 precursor RNA is designated SEQ ID:75371, and is provided

hereinbelow with reference to the sequence listing part.

[46861] VGAM3350 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46862] An enzyme complex designated DICER COMPLEX, dices the VGAM3350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3350 RNA is designated SEQ ID:75372, and is provided hereinbelow with reference to the sequence listing part.

[46863] VGAM3350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46864] VGAM3350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3350 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3350 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46865] The complementary binding of VGAM3350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3350 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46866] It is appreciated that VGAM3350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3350 host target genes. The mRNA of each one of this plurality of VGAM3350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3350 RNA, herein designated VGAM RNA, and which when bound by VGAM3350 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3350 host target proteins.

[46867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3350 gene, herein designated VGAM GENE, on one or more VGAM3350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46868] It is yet further appreciated that a function of VGAM3350 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3350 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM3350 correlate with, and may be deduced from, the identity of the host target genes which VGAM3350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46869] Nucleotide sequences of the VGAM3350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3350 are further described hereinbelow with reference to Table 1.

[46870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46871] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3351 (VGAM3351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46872] VGAM3351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3351 was detected is described hereinabove with reference to Figs. 2–8.

[46873] VGAM3351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White clover mosaic virus. VGAM3351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46874] VGAM3351 gene, herein designated VGAM GENE, encodes a VGAM3351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3351 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3351 precursor RNA is designated SEQ ID:75374, and is provided hereinbelow with reference to the sequence listing part.

[46875] VGAM3351 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46876] An enzyme complex designated DICER COMPLEX, dices the VGAM3351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3351 RNA is designated SEQ ID:75375, and is provided hereinbelow with reference to the sequence listing part.

[46877] VGAM3351 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46878] VGAM3351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3351 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3351 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46879] The complementary binding of VGAM3351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3351 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46880] It is appreciated that VGAM3351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3351 host target genes. The mRNA of each one of this plurality of VGAM3351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3351 RNA, herein designated VGAM

RNA, and which when bound by VGAM3351 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3351 host target proteins.

[46881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3351 gene, herein designated VGAM GENE, on one or more VGAM3351 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46882] It is yet further appreciated that a function of VGAM3351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3351 include diagnosis, prevention and treatment of viral infection by White clover mosaic virus. Specific functions, and accordingly utilities, of VGAM3351 correlate with, and may be deduced from, the identity of the host target genes which VGAM3351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46883] Nucleotide sequences of the VGAM3351 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3351 are further described hereinbelow with reference to Table 1.

[46884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46885] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3352 (VGAM3352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46886] VGAM3352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3352 was detected is described hereinabove with reference to Figs. 2-8.

[46887] VGAM3352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM3352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46888] VGAM3352 gene, herein designated VGAM GENE, encodes a VGAM3352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3352 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3352 precursor RNA is designated SEQ ID:75403, and is provided hereinbelow with reference to the sequence listing part.

[46889] VGAM3352 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3352 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46890] An enzyme complex designated DICER COMPLEX, dices the VGAM3352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3352 RNA is designated SEQ ID:75404, and is provided hereinbelow with reference to the sequence listing part.

[46891] VGAM3352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3352 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3352 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46892] VGAM3352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3352 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3352 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46893] The complementary binding of VGAM3352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3352 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46894] It is appreciated that VGAM3352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3352 host target genes. The mRNA of each one of this plurality of VGAM3352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3352 RNA, herein designated VGAM RNA, and which when bound by VGAM3352 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3352 host target proteins.

[46895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3352 gene, herein designated VGAM GENE, on one

or more VGAM3352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46896] It is yet further appreciated that a function of VGAM3352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3352 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM3352 correlate with, and may be deduced from, the identity of the host target genes which VGAM3352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46897] Nucleotide sequences of the VGAM3352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3352 are further described hereinbelow with reference to Table 1.

[46898] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46899] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3353 (VGAM3353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46900] VGAM3353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3353 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[46901] VGAM3353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 53. VGAM3353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46902] VGAM3353 gene, herein designated VGAM GENE, encodes a VGAM3353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3353 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3353 precursor RNA is designated SEQ ID:75408, and is provided hereinbelow with reference to the sequence listing part.

[46903] VGAM3353 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46904] An enzyme complex designated DICER COMPLEX, dices the VGAM3353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3353 RNA is designated SEQ ID:75409, and is provided hereinbelow with reference to the sequence listing part.

[46905] VGAM3353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46906] VGAM3353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3353 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46907] The complementary binding of VGAM3353 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3353 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46908] It is appreciated that VGAM3353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3353 host target genes. The mRNA of each one of this plurality of VGAM3353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3353 RNA, herein designated VGAM RNA, and which when bound by VGAM3353 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3353 host target proteins.

[46909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3353 gene, herein designated VGAM GENE, on one or more VGAM3353 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46910] It is yet further appreciated that a function of VGAM3353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3353 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 53. Specific functions, and accordingly utilities, of VGAM3353 correlate with, and may be deduced from, the identity of the host target genes which VGAM3353 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46911] Nucleotide sequences of the VGAM3353 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3353 are further described hereinbelow with reference to Table 1.

[46912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46913] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3354 (VGAM3354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46914] VGAM3354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3354 was detected is described hereinabove with reference to Figs. 2-8.

[46915] VGAM3354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46916] VGAM3354 gene, herein designated VGAM GENE, encodes a VGAM3354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3354 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3354 precursor RNA is designated SEQ ID:75420, and is provided hereinbelow with reference to the sequence listing part.

[46917] VGAM3354 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[46918] An enzyme complex designated DICER COMPLEX, dices the VGAM3354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3354 RNA is designated SEQ ID:75421, and is provided hereinbelow with reference to the sequence listing part.

[46919] VGAM3354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46920] VGAM3354 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3354 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46921] The complementary binding of VGAM3354 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3354 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46922] It is appreciated that VGAM3354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3354 host target genes. The mRNA of each one of this plurality of VGAM3354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3354 RNA, herein designated VGAM RNA, and which when bound by VGAM3354 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3354 host target proteins.

[46923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3354 gene, herein designated VGAM GENE, on one or more VGAM3354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46924] It is yet further appreciated that a function of VGAM3354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3354 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3354 correlate with, and may be deduced from, the identity of the host target genes which VGAM3354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46925] Nucleotide sequences of the VGAM3354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3354 are further described hereinbelow with reference to Table 1.

[46926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46927] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3355 (VGAM3355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46928] VGAM3355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3355 was detected is described hereinabove with reference to Figs. 2-8.

[46929] VGAM3355 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tobacco vein mottling virus. VGAM3355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46930] VGAM3355 gene, herein designated VGAM GENE, encodes a VGAM3355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3355 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3355 precursor RNA is designated SEQ ID:75425, and is provided hereinbelow with reference to the sequence listing part.

[46931] VGAM3355 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46932] An enzyme complex designated DICER COMPLEX, dices the VGAM3355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3355 RNA is designated SEQ ID:75426, and is provided hereinbelow with reference to the sequence listing part.

[46933] VGAM3355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3355 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46934] VGAM3355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3355 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46935] The complementary binding of VGAM3355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3355 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3355 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46936] It is appreciated that VGAM3355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3355 host target genes. The mRNA of each one of this plurality of VGAM3355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3355 RNA, herein designated VGAM RNA, and which when bound by VGAM3355 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3355 host target proteins.

[46937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3355 gene, herein designated VGAM GENE, on one or more VGAM3355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46938] It is yet further appreciated that a function of VGAM3355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3355 include diagnosis, prevention and treatment of viral infection by Tobacco vein mottling virus. Specific functions, and accordingly utilities, of VGAM3355 correlate with, and may be deduced from, the identity of the host target genes which VGAM3355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46939] Nucleotide sequences of the VGAM3355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3355 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3355 are further described hereinbelow with reference to Table 1.

[46940] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46941] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3356 (VGAM3356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46942] VGAM3356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3356 was detected is described hereinabove with reference to Figs. 2-8.

[46943] VGAM3356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Giraffe-1.

VGAM3356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46944] VGAM3356 gene, herein designated VGAM GENE, encodes a VGAM3356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3356 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3356 precursor RNA is designated SEQ ID:75438, and is provided hereinbelow with reference to the sequence listing part.

[46945] VGAM3356 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46946] An enzyme complex designated DICER COMPLEX, dices

the VGAM3356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3356 RNA is designated SEQ ID:75439, and is provided hereinbelow with reference to the sequence listing part.

[46947] VGAM3356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3356 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46948] VGAM3356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3356 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3356 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46949] The complementary binding of VGAM3356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3356 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46950] It is appreciated that VGAM3356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3356 host target genes. The mRNA of each one of this plurality of VGAM3356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3356 RNA, herein designated VGAM RNA, and which when bound by VGAM3356 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3356 host target proteins.

[46951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3356 gene, herein designated VGAM GENE, on one or more VGAM3356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46952] It is yet further appreciated that a function of VGAM3356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3356 include diagnosis, prevention and treatment of viral infection by Pestivirus Giraffe-1. Specific functions, and accordingly utilities, of VGAM3356 correlate with, and may be deduced from, the identity of the host target genes which VGAM3356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46953] Nucleotide sequences of the VGAM3356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3356 are further described hereinbelow with reference to Table 1.

[46954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46955] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3357 (VGAM3357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46956] VGAM3357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3357 was detected is described hereinabove with reference to Figs. 2-8.

[46957] VGAM3357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mushroom bacilliform virus. VGAM3357 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46958] VGAM3357 gene, herein designated VGAM GENE, encodes a VGAM3357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3357 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3357 precursor RNA is designated SEQ ID:75449, and is provided hereinbelow with reference to the sequence listing part.

[46959] VGAM3357 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46960] An enzyme complex designated DICER COMPLEX, dices the VGAM3357 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3357 RNA is designated SEQ ID:75450, and is provided hereinbelow with reference to the sequence listing part.

[46961] VGAM3357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3357 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46962] VGAM3357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3357 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3357 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46963] The complementary binding of VGAM3357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3357

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46964] It is appreciated that VGAM3357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3357 host target genes. The mRNA of each one of this plurality of VGAM3357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3357 RNA, herein designated VGAM RNA, and which when bound by VGAM3357 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3357 host target proteins.

[46965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3357 gene, herein designated VGAM GENE, on one or more VGAM3357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46966] It is yet further appreciated that a function of VGAM3357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3357 include diagnosis, prevention and treatment of viral infection by Mushroom bacilliform virus. Specific functions, and accordingly utilities, of VGAM3357 correlate with, and may be deduced from, the identity of the host target genes which VGAM3357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46967] Nucleotide sequences of the VGAM3357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3357 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3357 are further described hereinbelow with reference to Table 1.

[46968] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46969] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3358 (VGAM3358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46970] VGAM3358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3358 was detected is described hereinabove with reference to Figs. 2-8.

[46971] VGAM3358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Maize dwarf mosaic virus. VGAM3358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[46972] VGAM3358 gene, herein designated VGAM GENE, encodes a VGAM3358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3358 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3358 precursor RNA is designated SEQ ID:75456, and is provided hereinbelow with reference to the sequence listing part.

[46973] VGAM3358 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46974] An enzyme complex designated DICER COMPLEX, dices the VGAM3358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3358 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3358 RNA is designated SEQ ID:75457, and is provided hereinbelow with reference to the sequence listing part.

[46975] VGAM3358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3358 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46976] VGAM3358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3358 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46977] The complementary binding of VGAM3358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3358 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46978] It is appreciated that VGAM3358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3358 host target genes. The mRNA of each one of this plurality of VGAM3358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3358 RNA, herein designated VGAM RNA, and which when bound by VGAM3358 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3358 host target proteins.

[46979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3358 gene, herein designated VGAM GENE, on one or more VGAM3358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46980] It is yet further appreciated that a function of VGAM3358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3358 include diagnosis, prevention and treatment of viral infection by Maize dwarf mosaic virus. Specific functions, and accordingly utilities, of VGAM3358 correlate with, and may be deduced from, the identity of the host target genes which VGAM3358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46981] Nucleotide sequences of the VGAM3358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3358 are further

described hereinbelow with reference to Table 1.

[46982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46983] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3359 (VGAM3359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46984] VGAM3359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3359 was detected is described hereinabove with reference to Figs. 2-8.

[46985] VGAM3359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46986] VGAM3359 gene, herein designated VGAM GENE, encodes a VGAM3359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3359 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3359 precursor RNA is designated SEQ ID:75459, and is provided hereinbelow with reference to the sequence listing part.

[46987] VGAM3359 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46988] An enzyme complex designated DICER COMPLEX, dices the VGAM3359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3359 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3359 RNA is designated SEQ ID:75460, and is provided hereinbelow with reference to the sequence listing part.

[46989] VGAM3359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[46990] VGAM3359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3359 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[46991] The complementary binding of VGAM3359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3359 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3359 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46992] It is appreciated that VGAM3359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3359 host target genes. The mRNA of each one of this plurality of VGAM3359 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3359 RNA, herein designated VGAM RNA, and which when bound by VGAM3359 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3359 host target proteins.

[46993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3359 gene, herein designated VGAM GENE, on one or more VGAM3359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[46994] It is yet further appreciated that a function of VGAM3359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3359 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3359 correlate with, and may be deduced from, the identity of the host target genes which VGAM3359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46995] Nucleotide sequences of the VGAM3359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3359 are further described hereinbelow with reference to Table 1.

[46996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46997] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3360 (VGAM3360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46998] VGAM3360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3360 was detected is described hereinabove with reference to Figs. 2-8.

[46999] VGAM3360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47000] VGAM3360 gene, herein designated VGAM GENE, encodes

a VGAM3360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3360 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3360 precursor RNA is designated SEQ ID:75467, and is provided hereinbelow with reference to the sequence listing part.

[47001] VGAM3360 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47002] An enzyme complex designated DICER COMPLEX, dices the VGAM3360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3360 RNA is designated SEQ ID:75468, and is provided hereinbelow with reference to the sequence listing part.

[47003] VGAM3360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47004] VGAM3360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3360 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47005] The complementary binding of VGAM3360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3360 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[47006] It is appreciated that VGAM3360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3360 host target genes. The mRNA of each one of this plurality of VGAM3360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3360 RNA, herein designated VGAM RNA, and which when bound by VGAM3360 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3360 host target proteins.

[47007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3360 gene, herein designated VGAM GENE, on one or more VGAM3360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47008] It is yet further appreciated that a function of VGAM3360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3360 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3360 correlate with, and may be deduced from, the identity of the host target genes which VGAM3360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47009] Nucleotide sequences of the VGAM3360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3360 are further described hereinbelow with reference to Table 1.

[47010] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47011] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3361 (VGAM3361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47012] VGAM3361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3361 was detected is described hereinabove with reference to Figs. 2-8.

[47013] VGAM3361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM3361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47014] VGAM3361 gene, herein designated VGAM GENE, encodes a VGAM3361 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3361 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3361 precursor RNA is designated SEQ ID:75474, and is provided hereinbelow with reference to the sequence listing part.

[47015] VGAM3361 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47016] An enzyme complex designated DICER COMPLEX, dices the VGAM3361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3361 RNA is designated SEQ ID:75475, and is provided hereinbelow with reference to the sequence listing part.

[47017] VGAM3361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47018] VGAM3361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3361 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47019] The complementary binding of VGAM3361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3361 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47020] It is appreciated that VGAM3361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3361 host target genes. The mRNA of each one of this plurality of VGAM3361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3361 RNA, herein designated VGAM RNA, and which when bound by VGAM3361 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3361 host target proteins.

[47021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3361 gene, herein designated VGAM GENE, on one or more VGAM3361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47022] It is yet further appreciated that a function of VGAM3361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3361 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM3361 correlate with, and may be deduced from, the identity of the host target genes which VGAM3361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47023] Nucleotide sequences of the VGAM3361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3361 are further described hereinbelow with reference to Table 1.

[47024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47025] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3362 (VGAM3362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47026] VGAM3362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3362 was detected is described hereinabove with reference to Figs. 2-8.

[47027] VGAM3362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47028] VGAM3362 gene, herein designated VGAM GENE, encodes a VGAM3362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3362 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3362 precursor RNA is designated SEQ ID:75495, and is provided hereinbelow with reference to the sequence listing part.

[47029] VGAM3362 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47030] An enzyme complex designated DICER COMPLEX, dices the VGAM3362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3362 RNA is designated SEQ ID:75496, and is provided hereinbelow with reference to the sequence listing part.

[47031] VGAM3362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47032] VGAM3362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3362 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47033] The complementary binding of VGAM3362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3362 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47034] It is appreciated that VGAM3362 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3362 host target genes. The mRNA of each one of this plurality of VGAM3362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3362 RNA, herein designated VGAM RNA, and which when bound by VGAM3362 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3362 host target proteins.

[47035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3362 gene, herein designated VGAM GENE, on one or more VGAM3362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47036] It is yet further appreciated that a function of VGAM3362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3362 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3362 correlate with, and may be deduced from, the identity of the host target genes which VGAM3362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47037] Nucleotide sequences of the VGAM3362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3362 are further described hereinbelow with reference to Table 1.

[47038] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47039] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3363 (VGAM3363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47040] VGAM3363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3363 was detected is described hereinabove with reference to Figs. 2–8.

[47041] VGAM3363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47042] VGAM3363 gene, herein designated VGAM GENE, encodes a VGAM3363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3363 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3363 precursor RNA is designated SEQ ID:75506, and is provided hereinbelow with reference to the sequence listing part.

[47043] VGAM3363 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47044] An enzyme complex designated DICER COMPLEX, dices the VGAM3363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3363 RNA is designated SEQ ID:75507, and is provided hereinbelow with reference to the sequence listing part.

[47045] VGAM3363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47046] VGAM3363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3363 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47047] The complementary binding of VGAM3363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3363 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47048] It is appreciated that VGAM3363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3363 host target genes. The mRNA of each one of this plurality of VGAM3363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3363 RNA, herein designated VGAM RNA, and which when bound by VGAM3363 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3363 host target proteins.

[47049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3363 gene, herein designated VGAM GENE, on one or more VGAM3363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [47050] It is yet further appreciated that a function of VGAM3363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3363 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3363 correlate with, and may be deduced from, the identity of the host target genes which VGAM3363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [47051] Nucleotide sequences of the VGAM3363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3363 are further described hereinbelow with reference to Table 1.
- [47052] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47053] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3364 (VGAM3364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47054] VGAM3364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3364 was detected is described hereinabove with reference to Figs. 2–8.

[47055] VGAM3364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47056] VGAM3364 gene, herein designated VGAM GENE, encodes a VGAM3364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3364 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3364 precursor RNA is designated SEQ ID:75513, and is provided hereinbelow with reference to the sequence listing part.

[47057] VGAM3364 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47058] An enzyme complex designated DICER COMPLEX, dices the VGAM3364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3364 RNA is designated SEQ ID:75514, and is provided hereinbelow with reference to the sequence listing part.

[47059] VGAM3364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47060] VGAM3364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3364 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47061] The complementary binding of VGAM3364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3364 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47062] It is appreciated that VGAM3364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3364 host target genes. The mRNA of

each one of this plurality of VGAM3364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3364 RNA, herein designated VGAM RNA, and which when bound by VGAM3364 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3364 host target proteins.

[47063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3364 gene, herein designated VGAM GENE, on one or more VGAM3364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[47064] It is yet further appreciated that a function of VGAM3364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3364 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3364 correlate with, and may be deduced from, the identity of the host target genes which VGAM3364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47065] Nucleotide sequences of the VGAM3364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3364 are further described hereinbelow with reference to Table 1.

[47066] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3364 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[47067] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3365 (VGAM3365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47068] VGAM3365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3365 was detected is described hereinabove with reference to Figs. 2–8.

[47069] VGAM3365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47070] VGAM3365 gene, herein designated VGAM GENE, encodes a VGAM3365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3365 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3365 precursor RNA is designated SEQ ID:75557, and is provided hereinbelow with reference to the sequence listing part.

[47071] VGAM3365 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47072] An enzyme complex designated DICER COMPLEX, dices the VGAM3365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3365 RNA is designated SEQ ID:75558,

and is provided hereinbelow with reference to the sequence listing part.

[47073] VGAM3365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47074] VGAM3365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3365 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47075] The complementary binding of VGAM3365 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3365 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47076] It is appreciated that VGAM3365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3365 host target genes. The mRNA of each one of this plurality of VGAM3365 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3365 RNA, herein designated VGAM RNA, and which when bound by VGAM3365 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3365 host target proteins.

[47077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3365 gene, herein designated VGAM GENE, on one or more VGAM3365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47078] It is yet further appreciated that a function of VGAM3365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3365 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3365 correlate with, and may be deduced from, the identity of the host target genes which VGAM3365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47079] Nucleotide sequences of the VGAM3365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3365 are further described hereinbelow with reference to Table 1.

[47080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47081] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3366 (VGAM3366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47082] VGAM3366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3366 was detected is described hereinabove with reference to Figs. 2–8.

[47083] VGAM3366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47084] VGAM3366 gene, herein designated VGAM GENE, encodes a VGAM3366 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3366 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3366 precu-

sor RNA is designated SEQ ID:75562, and is provided hereinbelow with reference to the sequence listing part.

[47085] VGAM3366 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47086] An enzyme complex designated DICER COMPLEX, dices the VGAM3366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3366 RNA is designated SEQ ID:75563, and is provided hereinbelow with reference to the se-

quence listing part.

[47087] VGAM3366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47088] VGAM3366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3366 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47089] The complementary binding of VGAM3366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3366 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47090] It is appreciated that VGAM3366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3366 host target genes. The mRNA of each one of this plurality of VGAM3366 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3366 RNA, herein designated VGAM RNA, and which when bound by VGAM3366 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3366 host target proteins.

[47091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3366 gene, herein designated VGAM GENE, on one or more VGAM3366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47092] It is yet further appreciated that a function of VGAM3366

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3366 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3366 correlate with, and may be deduced from, the identity of the host target genes which VGAM3366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47093] Nucleotide sequences of the VGAM3366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3366 are further described hereinbelow with reference to Table 1.

[47094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47095] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3367 (VGAM3367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47096] VGAM3367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3367 was detected is described hereinabove with reference to Figs. 2–8.

[47097] VGAM3367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47098] VGAM3367 gene, herein designated VGAM GENE, encodes a VGAM3367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3367 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3367 precursor RNA is designated SEQ ID:75586, and is provided

hereinbelow with reference to the sequence listing part.

[47099] VGAM3367 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47100] An enzyme complex designated DICER COMPLEX, dices the VGAM3367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3367 RNA is designated SEQ ID:75587, and is provided hereinbelow with reference to the sequence listing part.

[47101] VGAM3367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47102] VGAM3367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3367 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3367 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47103] The complementary binding of VGAM3367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3367 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47104] It is appreciated that VGAM3367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3367 host target genes. The mRNA of each one of this plurality of VGAM3367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3367 RNA, herein designated VGAM RNA, and which when bound by VGAM3367 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3367 host target proteins.

[47105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3367 gene, herein designated VGAM GENE, on one or more VGAM3367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47106] It is yet further appreciated that a function of VGAM3367 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3367 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3367 correlate with, and may be deduced from, the identity of the host target genes which VGAM3367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47107] Nucleotide sequences of the VGAM3367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3367 are further described hereinbelow with reference to Table 1.

[47108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47109] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3368 (VGAM3368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47110] VGAM3368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3368 was detected is described hereinabove with reference to Figs. 2–8.

[47111] VGAM3368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47112] VGAM3368 gene, herein designated VGAM GENE, encodes a VGAM3368 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3368 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3368 precursor RNA is designated SEQ ID:75628, and is provided hereinbelow with reference to the sequence listing part.

[47113] VGAM3368 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47114] An enzyme complex designated DICER COMPLEX, dices the VGAM3368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3368 RNA is designated SEQ ID:75629, and is provided hereinbelow with reference to the sequence listing part.

[47115] VGAM3368 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47116] VGAM3368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3368 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3368 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47117] The complementary binding of VGAM3368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3368 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47118] It is appreciated that VGAM3368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3368 host target genes. The mRNA of each one of this plurality of VGAM3368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3368 RNA, herein designated VGAM

RNA, and which when bound by VGAM3368 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3368 host target proteins.

[47119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3368 gene, herein designated VGAM GENE, on one or more VGAM3368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47120] It is yet further appreciated that a function of VGAM3368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3368 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3368 correlate with, and may be deduced from, the identity of the host target genes which VGAM3368 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47121] Nucleotide sequences of the VGAM3368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3368 are further described hereinbelow with reference to Table 1.

[47122] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47123] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3369 (VGAM3369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47124] VGAM3369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3369 was detected is described hereinabove with reference to Figs. 2–8.

[47125] VGAM3369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 70. VGAM3369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47126] VGAM3369 gene, herein designated VGAM GENE, encodes a VGAM3369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3369 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3369 precursor RNA is designated SEQ ID:75635, and is provided hereinbelow with reference to the sequence listing part.

[47127] VGAM3369 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47128] An enzyme complex designated DICER COMPLEX, dices the VGAM3369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3369 RNA is designated SEQ ID:75636, and is provided hereinbelow with reference to the sequence listing part.

[47129] VGAM3369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3369 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47130] VGAM3369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3369 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3369 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47131] The complementary binding of VGAM3369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3369 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47132] It is appreciated that VGAM3369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3369 host target genes. The mRNA of each one of this plurality of VGAM3369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3369 RNA, herein designated VGAM RNA, and which when bound by VGAM3369 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3369 host target proteins.

[47133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3369 gene, herein designated VGAM GENE, on one or more VGAM3369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47134] It is yet further appreciated that a function of VGAM3369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3369 include diagnosis, prevention and

treatment of viral infection by Human papillomavirus type 70. Specific functions, and accordingly utilities, of VGAM3369 correlate with, and may be deduced from, the identity of the host target genes which VGAM3369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47135] Nucleotide sequences of the VGAM3369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3369 are further described hereinbelow with reference to Table 1.

[47136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47137] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3370 (VGAM3370) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47138] VGAM3370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3370 was detected is described hereinabove with reference to Figs. 2–8.

[47139] VGAM3370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47140] VGAM3370 gene, herein designated VGAM GENE, encodes a VGAM3370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3370 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3370 precursor RNA is designated SEQ ID:75708, and is provided hereinbelow with reference to the sequence listing part.

[47141] VGAM3370 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3370 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47142] An enzyme complex designated DICER COMPLEX, dices the VGAM3370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3370 RNA is designated SEQ ID:75709, and is provided hereinbelow with reference to the sequence listing part.

[47143] VGAM3370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3370 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3370 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47144] VGAM3370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3370 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3370 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47145] The complementary binding of VGAM3370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3370 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47146] It is appreciated that VGAM3370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3370 host target genes. The mRNA of each one of this plurality of VGAM3370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3370 RNA, herein designated VGAM RNA, and which when bound by VGAM3370 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3370 host target proteins.

[47147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3370 gene, herein designated VGAM GENE, on one or more VGAM3370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47148] It is yet further appreciated that a function of VGAM3370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3370 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadi-

novirus. Specific functions, and accordingly utilities, of VGAM3370 correlate with, and may be deduced from, the identity of the host target genes which VGAM3370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47149] Nucleotide sequences of the VGAM3370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3370 are further described hereinbelow with reference to Table 1.

[47150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47151] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3371 (VGAM3371) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[47152] VGAM3371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3371 was detected is described hereinabove with reference to Figs. 2–8.

[47153] VGAM3371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut bud necrosis virus. VGAM3371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47154] VGAM3371 gene, herein designated VGAM GENE, encodes a VGAM3371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3371 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3371 precursor RNA is designated SEQ ID:75747, and is provided hereinbelow with reference to the sequence listing part.

[47155] VGAM3371 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3371 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47156] An enzyme complex designated DICER COMPLEX, dices the VGAM3371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3371 RNA is designated SEQ ID:75748, and is provided hereinbelow with reference to the sequence listing part.

[47157] VGAM3371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3371 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47158] VGAM3371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3371 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47159] The complementary binding of VGAM3371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3371 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47160] It is appreciated that VGAM3371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3371 host target genes. The mRNA of each one of this plurality of VGAM3371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3371 RNA, herein designated VGAM RNA, and which when bound by VGAM3371 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3371 host target proteins.

[47161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3371 gene, herein designated VGAM GENE, on one or more VGAM3371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47162] It is yet further appreciated that a function of VGAM3371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3371 include diagnosis, prevention and treatment of viral infection by Peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM3371

correlate with, and may be deduced from, the identity of the host target genes which VGAM3371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47163] Nucleotide sequences of the VGAM3371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3371 are further described hereinbelow with reference to Table 1.

[47164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47165] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3372 (VGAM3372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[47166] VGAM3372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3372 was detected is described hereinabove with reference to Figs. 2–8.

[47167] VGAM3372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47168] VGAM3372 gene, herein designated VGAM GENE, encodes a VGAM3372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3372 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3372 precursor RNA is designated SEQ ID:75775, and is provided hereinbelow with reference to the sequence listing part.

[47169] VGAM3372 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47170] An enzyme complex designated DICER COMPLEX, dices the VGAM3372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3372 RNA is designated SEQ ID:75776, and is provided hereinbelow with reference to the sequence listing part.

[47171] VGAM3372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47172] VGAM3372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3372 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3372 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47173] The complementary binding of VGAM3372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3372 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47174] It is appreciated that VGAM3372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3372 host target genes. The mRNA of each one of this plurality of VGAM3372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3372 RNA, herein designated VGAM RNA, and which when bound by VGAM3372 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3372 host target proteins.

[47175] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3372 gene, herein designated VGAM GENE, on one or more VGAM3372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47176] It is yet further appreciated that a function of VGAM3372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3372 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3372 correlate with, and may be deduced

from, the identity of the host target genes which VGAM3372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47177] Nucleotide sequences of the VGAM3372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3372 are further described hereinbelow with reference to Table 1.

[47178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47179] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3373 (VGAM3373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47180] VGAM3373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3373 was detected is described hereinabove with reference to Figs. 2–8.

[47181] VGAM3373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47182] VGAM3373 gene, herein designated VGAM GENE, encodes a VGAM3373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3373 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3373 precursor RNA is designated SEQ ID:75784, and is provided hereinbelow with reference to the sequence listing part.

[47183] VGAM3373 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47184] An enzyme complex designated DICER COMPLEX, dices the VGAM3373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3373 RNA is designated SEQ ID:75785, and is provided hereinbelow with reference to the sequence listing part.

[47185] VGAM3373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47186] VGAM3373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3373 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47187] The complementary binding of VGAM3373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3373 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47188] It is appreciated that VGAM3373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3373 host target genes. The mRNA of each one of this plurality of VGAM3373 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3373 RNA, herein designated VGAM RNA, and which when bound by VGAM3373 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3373 host target proteins.

[47189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3373 gene, herein designated VGAM GENE, on one or more VGAM3373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47190] It is yet further appreciated that a function of VGAM3373 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3373 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3373 correlate with, and may be deduced from, the identity of the host target genes which

VGAM3373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47191] Nucleotide sequences of the VGAM3373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3373 are further described hereinbelow with reference to Table 1.

[47192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47193] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3374 (VGAM3374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47194] VGAM3374 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3374 was detected is described hereinabove with reference to Figs. 2–8.

[47195] VGAM3374 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit oral papillomavirus. VGAM3374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47196] VGAM3374 gene, herein designated VGAM GENE, encodes a VGAM3374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3374 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3374 precursor RNA is designated SEQ ID:75800, and is provided hereinbelow with reference to the sequence listing part.

[47197] VGAM3374 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47198] An enzyme complex designated DICER COMPLEX, dices the VGAM3374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3374 RNA is designated SEQ ID:75801, and is provided hereinbelow with reference to the sequence listing part.

[47199] VGAM3374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47200] VGAM3374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3374 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[47201] The complementary binding of VGAM3374 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3374 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47202] It is appreciated that VGAM3374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3374 host target genes. The mRNA of each one of this plurality of VGAM3374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3374 RNA, herein designated VGAM RNA, and which when bound by VGAM3374 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3374 host target proteins.

[47203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3374 gene, herein designated VGAM GENE, on one or more VGAM3374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47204] It is yet further appreciated that a function of VGAM3374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3374 include diagnosis, prevention and treatment of viral infection by Rabbit oral papillomavirus. Specific functions, and accordingly utilities, of VGAM3374 correlate with, and may be deduced from, the identity of the host target genes which VGAM3374 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[47205] Nucleotide sequences of the VGAM3374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3374 are further described hereinbelow with reference to Table 1.

[47206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3374 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47207] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3375 (VGAM3375) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47208] VGAM3375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3375 was detected is described hereinabove with reference to Figs. 2–8.

[47209] VGAM3375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit oral papillomavirus. VGAM3375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47210] VGAM3375 gene, herein designated VGAM GENE, encodes a VGAM3375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3375 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3375 precursor RNA is designated SEQ ID:75811, and is provided hereinbelow with reference to the sequence listing part.

[47211] VGAM3375 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47212] An enzyme complex designated DICER COMPLEX, dices the VGAM3375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3375 RNA is designated SEQ ID:75812, and is provided hereinbelow with reference to the sequence listing part.

[47213] VGAM3375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[47214] VGAM3375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3375 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47215] The complementary binding of VGAM3375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3375 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47216] It is appreciated that VGAM3375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3375 host target genes. The mRNA of each one of this plurality of VGAM3375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3375 RNA, herein designated VGAM RNA, and which when bound by VGAM3375 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3375 host target proteins.

[47217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3375 gene, herein designated VGAM GENE, on one

or more VGAM3375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47218] It is yet further appreciated that a function of VGAM3375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3375 include diagnosis, prevention and treatment of viral infection by Rabbit oral papillomavirus. Specific functions, and accordingly utilities, of VGAM3375 correlate with, and may be deduced from, the identity of the host target genes which VGAM3375 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47219] Nucleotide sequences of the VGAM3375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3375 are further described hereinbelow with reference to Table 1.

[47220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47221] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3376 (VGAM3376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47222] VGAM3376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3376 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[47223] VGAM3376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 28. VGAM3376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47224] VGAM3376 gene, herein designated VGAM GENE, encodes a VGAM3376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3376 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3376 precursor RNA is designated SEQ ID:75824, and is provided hereinbelow with reference to the sequence listing part.

[47225] VGAM3376 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47226] An enzyme complex designated DICER COMPLEX, dices the VGAM3376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3376 RNA is designated SEQ ID:75825, and is provided hereinbelow with reference to the sequence listing part.

[47227] VGAM3376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47228] VGAM3376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3376 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47229] The complementary binding of VGAM3376 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3376 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47230] It is appreciated that VGAM3376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3376 host target genes. The mRNA of each one of this plurality of VGAM3376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3376 RNA, herein designated VGAM RNA, and which when bound by VGAM3376 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3376 host target proteins.

[47231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3376 gene, herein designated VGAM GENE, on one or more VGAM3376 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47232] It is yet further appreciated that a function of VGAM3376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3376 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 28. Specific functions, and accordingly utilities, of VGAM3376 correlate with, and may be deduced from, the identity of the host target genes which VGAM3376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47233] Nucleotide sequences of the VGAM3376 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3376 are further described hereinbelow with reference to Table 1.

[47234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47235] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3377 (VGAM3377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47236] VGAM3377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3377 was detected is described hereinabove with reference to Figs. 2-8.

[47237] VGAM3377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM3377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47238] VGAM3377 gene, herein designated VGAM GENE, encodes a VGAM3377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3377 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3377 precursor RNA is designated SEQ ID:75857, and is provided hereinbelow with reference to the sequence listing part.

[47239] VGAM3377 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[47240] An enzyme complex designated DICER COMPLEX, dices the VGAM3377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3377 RNA is designated SEQ ID:75858, and is provided hereinbelow with reference to the sequence listing part.

[47241] VGAM3377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47242] VGAM3377 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3377 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47243] The complementary binding of VGAM3377 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3377 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47244] It is appreciated that VGAM3377 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3377 host target genes. The mRNA of each one of this plurality of VGAM3377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3377 RNA, herein designated VGAM RNA, and which when bound by VGAM3377 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3377 host target proteins.

[47245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3377 gene, herein designated VGAM GENE, on one or more VGAM3377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47246] It is yet further appreciated that a function of VGAM3377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3377 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM3377 correlate with, and may be deduced from, the identity of the host target genes which VGAM3377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47247] Nucleotide sequences of the VGAM3377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3377 are further described hereinbelow with reference to Table 1.

[47248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47249] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3378 (VGAM3378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47250] VGAM3378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3378 was detected is described hereinabove with reference to Figs. 2-8.

[47251] VGAM3378 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 5. VGAM3378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47252] VGAM3378 gene, herein designated VGAM GENE, encodes a VGAM3378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3378 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3378 precursor RNA is designated SEQ ID:75864, and is provided hereinbelow with reference to the sequence listing part.

[47253] VGAM3378 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47254] An enzyme complex designated DICER COMPLEX, dices the VGAM3378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3378 RNA is designated SEQ ID:75865, and is provided hereinbelow with reference to the sequence listing part.

[47255] VGAM3378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3378 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47256] VGAM3378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3378 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47257] The complementary binding of VGAM3378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3378 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3378 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47258] It is appreciated that VGAM3378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3378 host target genes. The mRNA of each one of this plurality of VGAM3378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3378 RNA, herein designated VGAM RNA, and which when bound by VGAM3378 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3378 host target proteins.

[47259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3378 gene, herein designated VGAM GENE, on one or more VGAM3378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47260] It is yet further appreciated that a function of VGAM3378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3378 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3378 correlate with, and may be deduced from, the identity of the host target genes which VGAM3378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47261] Nucleotide sequences of the VGAM3378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3378 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3378 are further described hereinbelow with reference to Table 1.

[47262] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47263] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3379 (VGAM3379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47264] VGAM3379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3379 was detected is described hereinabove with reference to Figs. 2-8.

[47265] VGAM3379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5.

VGAM3379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47266] VGAM3379 gene, herein designated VGAM GENE, encodes a VGAM3379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3379 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3379 precursor RNA is designated SEQ ID:75871, and is provided hereinbelow with reference to the sequence listing part.

[47267] VGAM3379 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47268] An enzyme complex designated DICER COMPLEX, dices

the VGAM3379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3379 RNA is designated SEQ ID:75872, and is provided hereinbelow with reference to the sequence listing part.

[47269] VGAM3379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3379 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47270] VGAM3379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3379 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3379 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47271] The complementary binding of VGAM3379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3379 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47272] It is appreciated that VGAM3379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3379 host target genes. The mRNA of each one of this plurality of VGAM3379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3379 RNA, herein designated VGAM RNA, and which when bound by VGAM3379 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3379 host target proteins.

[47273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3379 gene, herein designated VGAM GENE, on one or more VGAM3379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47274] It is yet further appreciated that a function of VGAM3379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3379 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3379 correlate with, and may be deduced from, the identity of the host target genes which VGAM3379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47275] Nucleotide sequences of the VGAM3379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3379 are further described hereinbelow with reference to Table 1.

[47276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47277] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3380 (VGAM3380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47278] VGAM3380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3380 was detected is described hereinabove with reference to Figs. 2-8.

[47279] VGAM3380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3380 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[47280] VGAM3380 gene, herein designated VGAM GENE, encodes a VGAM3380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3380 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3380 precursor RNA is designated SEQ ID:75895, and is provided hereinbelow with reference to the sequence listing part.

[47281] VGAM3380 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47282] An enzyme complex designated DICER COMPLEX, dices the VGAM3380 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3380 RNA is designated SEQ ID:75896, and is provided hereinbelow with reference to the sequence listing part.

[47283] VGAM3380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3380 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47284] VGAM3380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3380 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3380 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47285] The complementary binding of VGAM3380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3380

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47286] It is appreciated that VGAM3380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3380 host target genes. The mRNA of each one of this plurality of VGAM3380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3380 RNA, herein designated VGAM RNA, and which when bound by VGAM3380 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3380 host target proteins.

[47287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3380 gene, herein designated VGAM GENE, on one or more VGAM3380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47288] It is yet further appreciated that a function of VGAM3380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3380 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3380 correlate with, and may be deduced from, the identity of the host target genes which VGAM3380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47289] Nucleotide sequences of the VGAM3380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3380 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3380 are further described hereinbelow with reference to Table 1.

[47290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47291] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3381 (VGAM3381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47292] VGAM3381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3381 was detected is described hereinabove with reference to Figs. 2-8.

[47293] VGAM3381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[47294] VGAM3381 gene, herein designated VGAM GENE, encodes a VGAM3381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3381 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3381 precursor RNA is designated SEQ ID:75918, and is provided hereinbelow with reference to the sequence listing part.

[47295] VGAM3381 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47296] An enzyme complex designated DICER COMPLEX, dices the VGAM3381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3381 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3381 RNA is designated SEQ ID:75919, and is provided hereinbelow with reference to the sequence listing part.

[47297] VGAM3381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3381 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47298] VGAM3381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3381 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47299] The complementary binding of VGAM3381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3381 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47300] It is appreciated that VGAM3381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3381 host target genes. The mRNA of each one of this plurality of VGAM3381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3381 RNA, herein designated VGAM RNA, and which when bound by VGAM3381 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3381 host target proteins.

[47301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3381 gene, herein designated VGAM GENE, on one or more VGAM3381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47302] It is yet further appreciated that a function of VGAM3381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3381 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3381 correlate with, and may be deduced from, the identity of the host target genes which VGAM3381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47303] Nucleotide sequences of the VGAM3381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3381 are further

described hereinbelow with reference to Table 1.

[47304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47305] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3382 (VGAM3382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47306] VGAM3382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3382 was detected is described hereinabove with reference to Figs. 2-8.

[47307] VGAM3382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47308] VGAM3382 gene, herein designated VGAM GENE, encodes a VGAM3382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3382 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3382 precursor RNA is designated SEQ ID:75940, and is provided hereinbelow with reference to the sequence listing part.

[47309] VGAM3382 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47310] An enzyme complex designated DICER COMPLEX, dices the VGAM3382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3382 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3382 RNA is designated SEQ ID:75941, and is provided hereinbelow with reference to the sequence listing part.

[47311] VGAM3382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47312] VGAM3382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3382 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47313] The complementary binding of VGAM3382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3382 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3382 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47314] It is appreciated that VGAM3382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3382 host target genes. The mRNA of each one of this plurality of VGAM3382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3382 RNA, herein designated VGAM RNA, and which when bound by VGAM3382 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3382 host target proteins.

[47315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3382 gene, herein designated VGAM GENE, on one or more VGAM3382 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47316] It is yet further appreciated that a function of VGAM3382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3382 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3382 correlate with, and may be deduced from, the identity of the host target genes which VGAM3382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47317] Nucleotide sequences of the VGAM3382 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3382 are further described hereinbelow with reference to Table 1.

[47318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47319] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3383 (VGAM3383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47320] VGAM3383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3383 was detected is described hereinabove with reference to Figs. 2-8.

[47321] VGAM3383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM3383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47322] VGAM3383 gene, herein designated VGAM GENE, encodes

a VGAM3383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3383 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3383 precursor RNA is designated SEQ ID:75959, and is provided hereinbelow with reference to the sequence listing part.

[47323] VGAM3383 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47324] An enzyme complex designated DICER COMPLEX, dices the VGAM3383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3383 RNA is designated SEQ ID:75960, and is provided hereinbelow with reference to the sequence listing part.

[47325] VGAM3383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47326] VGAM3383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3383 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47327] The complementary binding of VGAM3383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3383 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[47328] It is appreciated that VGAM3383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3383 host target genes. The mRNA of each one of this plurality of VGAM3383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3383 RNA, herein designated VGAM RNA, and which when bound by VGAM3383 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3383 host target proteins.

[47329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3383 gene, herein designated VGAM GENE, on one or more VGAM3383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47330] It is yet further appreciated that a function of VGAM3383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3383 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM3383 correlate with, and may be deduced from, the identity of the host target genes which VGAM3383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47331] Nucleotide sequences of the VGAM3383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3383 are further described hereinbelow with reference to Table 1.

[47332] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47333] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3384 (VGAM3384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47334] VGAM3384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3384 was detected is described hereinabove with reference to Figs. 2-8.

[47335] VGAM3384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3384 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47336] VGAM3384 gene, herein designated VGAM GENE, encodes a VGAM3384 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3384 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3384 precursor RNA is designated SEQ ID:75969, and is provided hereinbelow with reference to the sequence listing part.

[47337] VGAM3384 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47338] An enzyme complex designated DICER COMPLEX, dices the VGAM3384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3384 RNA is designated SEQ ID:75970, and is provided hereinbelow with reference to the sequence listing part.

[47339] VGAM3384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47340] VGAM3384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3384 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47341] The complementary binding of VGAM3384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3384 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47342] It is appreciated that VGAM3384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3384 host target genes. The mRNA of each one of this plurality of VGAM3384 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3384 RNA, herein designated VGAM RNA, and which when bound by VGAM3384 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3384 host target proteins.

[47343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3384 gene, herein designated VGAM GENE, on one or more VGAM3384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47344] It is yet further appreciated that a function of VGAM3384 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3384 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3384 correlate with, and may be deduced from, the identity of the host target genes which VGAM3384 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47345] Nucleotide sequences of the VGAM3384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3384 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3384 are further described hereinbelow with reference to Table 1.

[47346] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47347] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3385 (VGAM3385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47348] VGAM3385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3385 was detected is described hereinabove with reference to Figs. 2-8.

[47349] VGAM3385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47350] VGAM3385 gene, herein designated VGAM GENE, encodes a VGAM3385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3385 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3385 precursor RNA is designated SEQ ID:75973, and is provided hereinbelow with reference to the sequence listing part.

[47351] VGAM3385 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47352] An enzyme complex designated DICER COMPLEX, dices the VGAM3385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3385 RNA is designated SEQ ID:75974, and is provided hereinbelow with reference to the sequence listing part.

[47353] VGAM3385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47354] VGAM3385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3385 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47355] The complementary binding of VGAM3385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3385 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47356] It is appreciated that VGAM3385 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3385 host target genes. The mRNA of each one of this plurality of VGAM3385 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3385 RNA, herein designated VGAM RNA, and which when bound by VGAM3385 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3385 host target proteins.

[47357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3385 gene, herein designated VGAM GENE, on one or more VGAM3385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47358] It is yet further appreciated that a function of VGAM3385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3385 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3385 correlate with, and may be deduced from, the identity of the host target genes which VGAM3385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47359] Nucleotide sequences of the VGAM3385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3385 are further described hereinbelow with reference to Table 1.

[47360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47361] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3386 (VGAM3386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47362] VGAM3386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3386 was detected is described hereinabove with reference to Figs. 2–8.

[47363] VGAM3386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47364] VGAM3386 gene, herein designated VGAM GENE, encodes a VGAM3386 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3386 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3386 precursor RNA is designated SEQ ID:75990, and is provided hereinbelow with reference to the sequence listing part.

[47365] VGAM3386 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47366] An enzyme complex designated DICER COMPLEX, dices the VGAM3386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3386 RNA is designated SEQ ID:75991, and is provided hereinbelow with reference to the sequence listing part.

[47367] VGAM3386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47368] VGAM3386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3386 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47369] The complementary binding of VGAM3386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3386 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47370] It is appreciated that VGAM3386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3386 host target genes. The mRNA of each one of this plurality of VGAM3386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3386 RNA, herein designated VGAM RNA, and which when bound by VGAM3386 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3386 host target proteins.

[47371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3386 gene, herein designated VGAM GENE, on one or more VGAM3386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [47372] It is yet further appreciated that a function of VGAM3386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3386 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3386 correlate with, and may be deduced from, the identity of the host target genes which VGAM3386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [47373] Nucleotide sequences of the VGAM3386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3386 are further described hereinbelow with reference to Table 1.
- [47374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3386 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47375] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3387 (VGAM3387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47376] VGAM3387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3387 was detected is described hereinabove with reference to Figs. 2-8.

[47377] VGAM3387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Influenza A virus. VGAM3387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47378] VGAM3387 gene, herein designated VGAM GENE, encodes a VGAM3387 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3387 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3387 precursor RNA is designated SEQ ID:75997, and is provided hereinbelow with reference to the sequence listing part.

[47379] VGAM3387 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47380] An enzyme complex designated DICER COMPLEX, dices the VGAM3387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3387 RNA is designated SEQ ID:75998, and is provided hereinbelow with reference to the sequence listing part.

[47381] VGAM3387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47382] VGAM3387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3387 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47383] The complementary binding of VGAM3387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3387 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47384] It is appreciated that VGAM3387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3387 host target genes. The mRNA of

each one of this plurality of VGAM3387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3387 RNA, herein designated VGAM RNA, and which when bound by VGAM3387 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3387 host target proteins.

[47385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3387 gene, herein designated VGAM GENE, on one or more VGAM3387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[47386] It is yet further appreciated that a function of VGAM3387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3387 include diagnosis, prevention and treatment of viral infection by Influenza A virus. Specific functions, and accordingly utilities, of VGAM3387 correlate with, and may be deduced from, the identity of the host target genes which VGAM3387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47387] Nucleotide sequences of the VGAM3387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3387 are further described hereinbelow with reference to Table 1.

[47388] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3387 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[47389] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3388 (VGAM3388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47390] VGAM3388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3388 was detected is described hereinabove with reference to Figs. 2–8.

[47391] VGAM3388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 57. VGAM3388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47392] VGAM3388 gene, herein designated VGAM GENE, encodes a VGAM3388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3388 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3388 precursor RNA is designated SEQ ID:76049, and is provided hereinbelow with reference to the sequence listing part.

[47393] VGAM3388 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47394] An enzyme complex designated DICER COMPLEX, dices the VGAM3388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3388 RNA is designated SEQ ID:76050,

and is provided hereinbelow with reference to the sequence listing part.

[47395] VGAM3388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47396] VGAM3388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3388 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47397] The complementary binding of VGAM3388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3388 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47398] It is appreciated that VGAM3388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3388 host target genes. The mRNA of each one of this plurality of VGAM3388 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3388 RNA, herein designated VGAM RNA, and which when bound by VGAM3388 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3388 host target proteins.

[47399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3388 gene, herein designated VGAM GENE, on one or more VGAM3388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47400] It is yet further appreciated that a function of VGAM3388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3388 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 57. Specific functions, and accordingly utilities, of VGAM3388 correlate with, and may be deduced from, the identity of the host target genes which VGAM3388 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47401] Nucleotide sequences of the VGAM3388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3388 are further described hereinbelow with reference to Table 1.

[47402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47403] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3389 (VGAM3389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47404] VGAM3389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3389 was detected is described hereinabove with reference to Figs. 2–8.

[47405] VGAM3389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 10. VGAM3389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47406] VGAM3389 gene, herein designated VGAM GENE, encodes a VGAM3389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3389 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3389 precu-

sor RNA is designated SEQ ID:76067, and is provided hereinbelow with reference to the sequence listing part.

[47407] VGAM3389 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47408] An enzyme complex designated DICER COMPLEX, dices the VGAM3389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3389 RNA is designated SEQ ID:76068, and is provided hereinbelow with reference to the se-

quence listing part.

[47409] VGAM3389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47410] VGAM3389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3389 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47411] The complementary binding of VGAM3389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3389 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47412] It is appreciated that VGAM3389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3389 host target genes. The mRNA of each one of this plurality of VGAM3389 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3389 RNA, herein designated VGAM RNA, and which when bound by VGAM3389 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3389 host target proteins.

[47413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3389 gene, herein designated VGAM GENE, on one or more VGAM3389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47414] It is yet further appreciated that a function of VGAM3389

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3389 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 10. Specific functions, and accordingly utilities, of VGAM3389 correlate with, and may be deduced from, the identity of the host target genes which VGAM3389 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47415] Nucleotide sequences of the VGAM3389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3389 are further described hereinbelow with reference to Table 1.

[47416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47417] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3390 (VGAM3390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47418] VGAM3390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3390 was detected is described hereinabove with reference to Figs. 2–8.

[47419] VGAM3390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine fanleaf virus. VGAM3390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47420] VGAM3390 gene, herein designated VGAM GENE, encodes a VGAM3390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3390 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3390 precursor RNA is designated SEQ ID:76113, and is provided

hereinbelow with reference to the sequence listing part.

[47421] VGAM3390 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47422] An enzyme complex designated DICER COMPLEX, dices the VGAM3390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3390 RNA is designated SEQ ID:76114, and is provided hereinbelow with reference to the sequence listing part.

[47423] VGAM3390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47424] VGAM3390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3390 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3390 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47425] The complementary binding of VGAM3390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3390 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47426] It is appreciated that VGAM3390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3390 host target genes. The mRNA of each one of this plurality of VGAM3390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3390 RNA, herein designated VGAM RNA, and which when bound by VGAM3390 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3390 host target proteins.

[47427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3390 gene, herein designated VGAM GENE, on one or more VGAM3390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47428] It is yet further appreciated that a function of VGAM3390 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3390 include diagnosis, prevention and treatment of viral infection by Grapevine fanleaf virus. Specific functions, and accordingly utilities, of VGAM3390 correlate with, and may be deduced from, the identity of the host target genes which VGAM3390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47429] Nucleotide sequences of the VGAM3390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3390 are further described hereinbelow with reference to Table 1.

[47430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47431] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3391 (VGAM3391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47432] VGAM3391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3391 was detected is described hereinabove with reference to Figs. 2–8.

[47433] VGAM3391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM3391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47434] VGAM3391 gene, herein designated VGAM GENE, encodes a VGAM3391 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3391 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3391 precursor RNA is designated SEQ ID:76132, and is provided hereinbelow with reference to the sequence listing part.

[47435] VGAM3391 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47436] An enzyme complex designated DICER COMPLEX, dices the VGAM3391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3391 RNA is designated SEQ ID:76133, and is provided hereinbelow with reference to the sequence listing part.

[47437] VGAM3391 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47438] VGAM3391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3391 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3391 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47439] The complementary binding of VGAM3391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3391 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47440] It is appreciated that VGAM3391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3391 host target genes. The mRNA of each one of this plurality of VGAM3391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3391 RNA, herein designated VGAM

RNA, and which when bound by VGAM3391 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3391 host target proteins.

[47441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3391 gene, herein designated VGAM GENE, on one or more VGAM3391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47442] It is yet further appreciated that a function of VGAM3391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3391 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM3391 correlate with, and may be deduced from, the identity of the host target genes which VGAM3391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47443] Nucleotide sequences of the VGAM3391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3391 are further described hereinbelow with reference to Table 1.

[47444] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47445] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3392 (VGAM3392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47446] VGAM3392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3392 was detected is described hereinabove with reference to Figs. 2-8.

[47447] VGAM3392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM3392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47448] VGAM3392 gene, herein designated VGAM GENE, encodes a VGAM3392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3392 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3392 precursor RNA is designated SEQ ID:76139, and is provided hereinbelow with reference to the sequence listing part.

[47449] VGAM3392 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47450] An enzyme complex designated DICER COMPLEX, dices the VGAM3392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3392 RNA is designated SEQ ID:76140, and is provided hereinbelow with reference to the sequence listing part.

[47451] VGAM3392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3392 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47452] VGAM3392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3392 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3392 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47453] The complementary binding of VGAM3392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3392 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47454] It is appreciated that VGAM3392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3392 host target genes. The mRNA of each one of this plurality of VGAM3392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3392 RNA, herein designated VGAM RNA, and which when bound by VGAM3392 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3392 host target proteins.

[47455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3392 gene, herein designated VGAM GENE, on one or more VGAM3392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47456] It is yet further appreciated that a function of VGAM3392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3392 include diagnosis, prevention and

treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM3392 correlate with, and may be deduced from, the identity of the host target genes which VGAM3392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47457] Nucleotide sequences of the VGAM3392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3392 are further described hereinbelow with reference to Table 1.

[47458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47459] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3393 (VGAM3393) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47460] VGAM3393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3393 was detected is described hereinabove with reference to Figs. 2–8.

[47461] VGAM3393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM3393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47462] VGAM3393 gene, herein designated VGAM GENE, encodes a VGAM3393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3393 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3393 precursor RNA is designated SEQ ID:76144, and is provided hereinbelow with reference to the sequence listing part.

[47463] VGAM3393 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3393 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47464] An enzyme complex designated DICER COMPLEX, dices the VGAM3393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3393 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3393 RNA is designated SEQ ID:76145, and is provided hereinbelow with reference to the sequence listing part.

[47465] VGAM3393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3393 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3393 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47466] VGAM3393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3393 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3393 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47467] The complementary binding of VGAM3393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3393 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47468] It is appreciated that VGAM3393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3393 host target genes. The mRNA of each one of this plurality of VGAM3393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3393 RNA, herein designated VGAM RNA, and which when bound by VGAM3393 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3393 host target proteins.

[47469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3393 gene, herein designated VGAM GENE, on one or more VGAM3393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47470] It is yet further appreciated that a function of VGAM3393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3393 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific

functions, and accordingly utilities, of VGAM3393 correlate with, and may be deduced from, the identity of the host target genes which VGAM3393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47471] Nucleotide sequences of the VGAM3393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3393 are further described hereinbelow with reference to Table 1.

[47472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47473] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3394 (VGAM3394) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[47474] VGAM3394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3394 was detected is described hereinabove with reference to Figs. 2–8.

[47475] VGAM3394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47476] VGAM3394 gene, herein designated VGAM GENE, encodes a VGAM3394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3394 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3394 precursor RNA is designated SEQ ID:76150, and is provided hereinbelow with reference to the sequence listing part.

[47477] VGAM3394 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3394 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47478] An enzyme complex designated DICER COMPLEX, dices the VGAM3394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3394 RNA is designated SEQ ID:76151, and is provided hereinbelow with reference to the sequence listing part.

[47479] VGAM3394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3394 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47480] VGAM3394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3394 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47481] The complementary binding of VGAM3394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3394 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47482] It is appreciated that VGAM3394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3394 host target genes. The mRNA of each one of this plurality of VGAM3394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3394 RNA, herein designated VGAM RNA, and which when bound by VGAM3394 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3394 host target proteins.

[47483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3394 gene, herein designated VGAM GENE, on one or more VGAM3394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47484] It is yet further appreciated that a function of VGAM3394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3394 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly

utilities, of VGAM3394 correlate with, and may be deduced from, the identity of the host target genes which VGAM3394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47485] Nucleotide sequences of the VGAM3394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3394 are further described hereinbelow with reference to Table 1.

[47486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47487] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3395 (VGAM3395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[47488] VGAM3395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3395 was detected is described hereinabove with reference to Figs. 2–8.

[47489] VGAM3395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47490] VGAM3395 gene, herein designated VGAM GENE, encodes a VGAM3395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3395 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3395 precursor RNA is designated SEQ ID:76159, and is provided hereinbelow with reference to the sequence listing part.

[47491] VGAM3395 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47492] An enzyme complex designated DICER COMPLEX, dices the VGAM3395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3395 RNA is designated SEQ ID:76160, and is provided hereinbelow with reference to the sequence listing part.

[47493] VGAM3395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47494] VGAM3395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3395 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47495] The complementary binding of VGAM3395 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3395 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47496] It is appreciated that VGAM3395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3395 host target genes. The mRNA of each one of this plurality of VGAM3395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3395 RNA, herein designated VGAM RNA, and which when bound by VGAM3395 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3395 host target proteins.

[47497] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3395 gene, herein designated VGAM GENE, on one or more VGAM3395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47498] It is yet further appreciated that a function of VGAM3395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3395 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3395 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47499] Nucleotide sequences of the VGAM3395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3395 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3395 are further described hereinbelow with reference to Table 1.

[47500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47501] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3396 (VGAM3396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47502] VGAM3396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3396 was detected is described hereinabove with reference to Figs. 2–8.

[47503] VGAM3396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47504] VGAM3396 gene, herein designated VGAM GENE, encodes a VGAM3396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3396 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3396 precursor RNA is designated SEQ ID:76192, and is provided hereinbelow with reference to the sequence listing part.

[47505] VGAM3396 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47506] An enzyme complex designated DICER COMPLEX, dices the VGAM3396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3396 RNA is designated SEQ ID:76193, and is provided hereinbelow with reference to the sequence listing part.

[47507] VGAM3396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47508] VGAM3396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3396 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47509] The complementary binding of VGAM3396 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3396 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47510] It is appreciated that VGAM3396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3396 host target genes. The mRNA of each one of this plurality of VGAM3396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3396 RNA, herein designated VGAM RNA, and which when bound by VGAM3396 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3396 host target proteins.

[47511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3396 gene, herein designated VGAM GENE, on one or more VGAM3396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47512] It is yet further appreciated that a function of VGAM3396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3396 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3396 correlate with, and may be deduced from, the identity of the host target genes which

VGAM3396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47513] Nucleotide sequences of the VGAM3396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3396 are further described hereinbelow with reference to Table 1.

[47514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47515] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3397 (VGAM3397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47516] VGAM3397 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3397 was detected is described hereinabove with reference to Figs. 2–8.

[47517] VGAM3397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM3397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47518] VGAM3397 gene, herein designated VGAM GENE, encodes a VGAM3397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3397 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3397 precursor RNA is designated SEQ ID:76212, and is provided hereinbelow with reference to the sequence listing part.

[47519] VGAM3397 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47520] An enzyme complex designated DICER COMPLEX, dices the VGAM3397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3397 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3397 RNA is designated SEQ ID:76213, and is provided hereinbelow with reference to the sequence listing part.

[47521] VGAM3397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47522] VGAM3397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3397 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[47523] The complementary binding of VGAM3397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3397 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47524] It is appreciated that VGAM3397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3397 host target genes. The mRNA of each one of this plurality of VGAM3397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3397 RNA, herein designated VGAM RNA, and which when bound by VGAM3397 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3397 host target proteins.

[47525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3397 gene, herein designated VGAM GENE, on one or more VGAM3397 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47526] It is yet further appreciated that a function of VGAM3397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3397 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3397 correlate with, and may be deduced from, the identity of the host target genes which VGAM3397 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[47527] Nucleotide sequences of the VGAM3397 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3397 are further described hereinbelow with reference to Table 1.

[47528] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47529] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3398 (VGAM3398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47530] VGAM3398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3398 was detected is described hereinabove with reference to Figs. 2–8.

[47531] VGAM3398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47532] VGAM3398 gene, herein designated VGAM GENE, encodes a VGAM3398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3398 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3398 precursor RNA is designated SEQ ID:76288, and is provided hereinbelow with reference to the sequence listing part.

[47533] VGAM3398 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47534] An enzyme complex designated DICER COMPLEX, dices the VGAM3398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3398 RNA is designated SEQ ID:76289, and is provided hereinbelow with reference to the sequence listing part.

[47535] VGAM3398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[47536] VGAM3398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3398 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47537] The complementary binding of VGAM3398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3398 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47538] It is appreciated that VGAM3398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3398 host target genes. The mRNA of each one of this plurality of VGAM3398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3398 RNA, herein designated VGAM RNA, and which when bound by VGAM3398 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3398 host target proteins.

[47539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3398 gene, herein designated VGAM GENE, on one

or more VGAM3398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47540] It is yet further appreciated that a function of VGAM3398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3398 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3398 correlate with, and may be deduced from, the identity of the host target genes which VGAM3398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47541] Nucleotide sequences of the VGAM3398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3398 are further described hereinbelow with reference to Table 1.

[47542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47543] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3399 (VGAM3399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47544] VGAM3399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3399 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[47545] VGAM3399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 50. VGAM3399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47546] VGAM3399 gene, herein designated VGAM GENE, encodes a VGAM3399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3399 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3399 precursor RNA is designated SEQ ID:76351, and is provided hereinbelow with reference to the sequence listing part.

[47547] VGAM3399 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47548] An enzyme complex designated DICER COMPLEX, dices the VGAM3399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3399 RNA is designated SEQ ID:76352, and is provided hereinbelow with reference to the sequence listing part.

[47549] VGAM3399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47550] VGAM3399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3399 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47551] The complementary binding of VGAM3399 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3399 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47552] It is appreciated that VGAM3399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3399 host target genes. The mRNA of each one of this plurality of VGAM3399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3399 RNA, herein designated VGAM RNA, and which when bound by VGAM3399 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3399 host target proteins.

[47553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3399 gene, herein designated VGAM GENE, on one or more VGAM3399 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47554] It is yet further appreciated that a function of VGAM3399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3399 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 50. Specific functions, and accordingly utilities, of VGAM3399 correlate with, and may be deduced from, the identity of the host target genes which VGAM3399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47555] Nucleotide sequences of the VGAM3399 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3399 are further described hereinbelow with reference to Table 1.

[47556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47557] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3400 (VGAM3400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47558] VGAM3400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3400 was detected is described hereinabove with reference to Figs. 2-8.

[47559] VGAM3400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Frog adenovirus 1.

VGAM3400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47560] VGAM3400 gene, herein designated VGAM GENE, encodes a VGAM3400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3400 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3400 precursor RNA is designated SEQ ID:76511, and is provided hereinbelow with reference to the sequence listing part.

[47561] VGAM3400 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[47562] An enzyme complex designated DICER COMPLEX, dices the VGAM3400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3400 RNA is designated SEQ ID:76512, and is provided hereinbelow with reference to the sequence listing part.

[47563] VGAM3400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47564] VGAM3400 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3400 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47565] The complementary binding of VGAM3400 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3400 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47566] It is appreciated that VGAM3400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3400 host target genes. The mRNA of each one of this plurality of VGAM3400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3400 RNA, herein designated VGAM RNA, and which when bound by VGAM3400 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3400 host target proteins.

[47567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3400 gene, herein designated VGAM GENE, on one or more VGAM3400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47568] It is yet further appreciated that a function of VGAM3400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3400 include diagnosis, prevention and treatment of viral infection by Frog adenovirus 1. Specific functions, and accordingly utilities, of VGAM3400 correlate with, and may be deduced from, the identity of the host target genes which VGAM3400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47569] Nucleotide sequences of the VGAM3400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3400 are further described hereinbelow with reference to Table 1.

[47570] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47571] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3401 (VGAM3401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47572] VGAM3401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3401 was detected is described hereinabove with reference to Figs. 2-8.

[47573] VGAM3401 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox virus.

VGAM3401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47574] VGAM3401 gene, herein designated VGAM GENE, encodes a VGAM3401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3401 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3401 precursor RNA is designated SEQ ID:76515, and is provided hereinbelow with reference to the sequence listing part.

[47575] VGAM3401 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47576] An enzyme complex designated DICER COMPLEX, dices the VGAM3401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3401 RNA is designated SEQ ID:76516, and is provided hereinbelow with reference to the sequence listing part.

[47577] VGAM3401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3401 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47578] VGAM3401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3401 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47579] The complementary binding of VGAM3401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3401 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3401 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47580] It is appreciated that VGAM3401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3401 host target genes. The mRNA of each one of this plurality of VGAM3401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3401 RNA, herein designated VGAM RNA, and which when bound by VGAM3401 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3401 host target proteins.

[47581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3401 gene, herein designated VGAM GENE, on one or more VGAM3401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47582] It is yet further appreciated that a function of VGAM3401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3401 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3401 correlate with, and may be deduced from, the identity of the host target genes which VGAM3401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47583] Nucleotide sequences of the VGAM3401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3401 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3401 are further described hereinbelow with reference to Table 1.

[47584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47585] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3402 (VGAM3402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47586] VGAM3402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3402 was detected is described hereinabove with reference to Figs. 2-8.

[47587] VGAM3402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Macaca mulatta* rhadi-

novirus. VGAM3402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47588] VGAM3402 gene, herein designated VGAM GENE, encodes a VGAM3402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3402 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3402 precursor RNA is designated SEQ ID:76521, and is provided hereinbelow with reference to the sequence listing part.

[47589] VGAM3402 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47590] An enzyme complex designated DICER COMPLEX, dices

the VGAM3402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3402 RNA is designated SEQ ID:76522, and is provided hereinbelow with reference to the sequence listing part.

[47591] VGAM3402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3402 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47592] VGAM3402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3402 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3402 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47593] The complementary binding of VGAM3402 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3402 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47594] It is appreciated that VGAM3402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3402 host target genes. The mRNA of each one of this plurality of VGAM3402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3402 RNA, herein designated VGAM RNA, and which when bound by VGAM3402 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3402 host target proteins.

[47595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3402 gene, herein designated VGAM GENE, on one or more VGAM3402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47596] It is yet further appreciated that a function of VGAM3402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3402 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM3402 correlate with, and may be deduced from, the identity of the host target genes which VGAM3402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47597] Nucleotide sequences of the VGAM3402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3402 are further described hereinbelow with reference to Table 1.

[47598] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47599] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3403 (VGAM3403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47600] VGAM3403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3403 was detected is described hereinabove with reference to Figs. 2-8.

[47601] VGAM3403 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3403 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47602] VGAM3403 gene, herein designated VGAM GENE, encodes a VGAM3403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3403 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3403 precursor RNA is designated SEQ ID:76529, and is provided hereinbelow with reference to the sequence listing part.

[47603] VGAM3403 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47604] An enzyme complex designated DICER COMPLEX, dices the VGAM3403 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3403 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3403 RNA is designated SEQ ID:76530, and is provided hereinbelow with reference to the sequence listing part.

[47605] VGAM3403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3403 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47606] VGAM3403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3403 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3403 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47607] The complementary binding of VGAM3403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3403

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47608] It is appreciated that VGAM3403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3403 host target genes. The mRNA of each one of this plurality of VGAM3403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3403 RNA, herein designated VGAM RNA, and which when bound by VGAM3403 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3403 host target proteins.

[47609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3403 gene, herein designated VGAM GENE, on one or more VGAM3403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47610] It is yet further appreciated that a function of VGAM3403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3403 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3403 correlate with, and may be deduced from, the identity of the host target genes which VGAM3403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47611] Nucleotide sequences of the VGAM3403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3403 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3403 are further described hereinbelow with reference to Table 1.

[47612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47613] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3404 (VGAM3404) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47614] VGAM3404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3404 was detected is described hereinabove with reference to Figs. 2-8.

[47615] VGAM3404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 48. VGAM3404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[47616] VGAM3404 gene, herein designated VGAM GENE, encodes a VGAM3404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3404 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3404 precursor RNA is designated SEQ ID:76539, and is provided hereinbelow with reference to the sequence listing part.

[47617] VGAM3404 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47618] An enzyme complex designated DICER COMPLEX, dices the VGAM3404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3404 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3404 RNA is designated SEQ ID:76540, and is provided hereinbelow with reference to the sequence listing part.

[47619] VGAM3404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3404 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47620] VGAM3404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3404 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47621] The complementary binding of VGAM3404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3404 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47622] It is appreciated that VGAM3404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3404 host target genes. The mRNA of each one of this plurality of VGAM3404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3404 RNA, herein designated VGAM RNA, and which when bound by VGAM3404 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3404 host target proteins.

[47623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3404 gene, herein designated VGAM GENE, on one or more VGAM3404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47624] It is yet further appreciated that a function of VGAM3404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3404 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 48. Specific functions, and accordingly utilities, of VGAM3404 correlate with, and may be deduced from, the identity of the host target genes which VGAM3404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47625] Nucleotide sequences of the VGAM3404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3404 are further

described hereinbelow with reference to Table 1.

[47626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47627] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3405 (VGAM3405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47628] VGAM3405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3405 was detected is described hereinabove with reference to Figs. 2-8.

[47629] VGAM3405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47630] VGAM3405 gene, herein designated VGAM GENE, encodes a VGAM3405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3405 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3405 precursor RNA is designated SEQ ID:76551, and is provided hereinbelow with reference to the sequence listing part.

[47631] VGAM3405 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47632] An enzyme complex designated DICER COMPLEX, dices the VGAM3405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3405 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3405 RNA is designated SEQ ID:76552, and is provided hereinbelow with reference to the sequence listing part.

[47633] VGAM3405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47634] VGAM3405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3405 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47635] The complementary binding of VGAM3405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3405 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3405 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47636] It is appreciated that VGAM3405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3405 host target genes. The mRNA of each one of this plurality of VGAM3405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3405 RNA, herein designated VGAM RNA, and which when bound by VGAM3405 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3405 host target proteins.

[47637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3405 gene, herein designated VGAM GENE, on one or more VGAM3405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47638] It is yet further appreciated that a function of VGAM3405 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3405 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3405 correlate with, and may be deduced from, the identity of the host target genes which VGAM3405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47639] Nucleotide sequences of the VGAM3405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3405 are further described hereinbelow with reference to Table 1.

[47640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47641] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3406 (VGAM3406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47642] VGAM3406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3406 was detected is described hereinabove with reference to Figs. 2-8.

[47643] VGAM3406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47644] VGAM3406 gene, herein designated VGAM GENE, encodes

a VGAM3406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3406 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3406 precursor RNA is designated SEQ ID:76555, and is provided hereinbelow with reference to the sequence listing part.

[47645] VGAM3406 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47646] An enzyme complex designated DICER COMPLEX, dices the VGAM3406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3406 RNA is designated SEQ ID:76556, and is provided hereinbelow with reference to the sequence listing part.

[47647] VGAM3406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47648] VGAM3406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3406 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47649] The complementary binding of VGAM3406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3406 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[47650] It is appreciated that VGAM3406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3406 host target genes. The mRNA of each one of this plurality of VGAM3406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3406 RNA, herein designated VGAM RNA, and which when bound by VGAM3406 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3406 host target proteins.

[47651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3406 gene, herein designated VGAM GENE, on one or more VGAM3406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47652] It is yet further appreciated that a function of VGAM3406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3406 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3406 correlate with, and may be deduced from, the identity of the host target genes which VGAM3406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47653] Nucleotide sequences of the VGAM3406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3406 are further described hereinbelow with reference to Table 1.

[47654] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47655] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3407 (VGAM3407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47656] VGAM3407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3407 was detected is described hereinabove with reference to Figs. 2-8.

[47657] VGAM3407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute bee paralysis virus. VGAM3407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47658] VGAM3407 gene, herein designated VGAM GENE, encodes a VGAM3407 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3407 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3407 precursor RNA is designated SEQ ID:76569, and is provided hereinbelow with reference to the sequence listing part.

[47659] VGAM3407 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47660] An enzyme complex designated DICER COMPLEX, dices the VGAM3407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3407 RNA is designated SEQ ID:76570, and is provided hereinbelow with reference to the sequence listing part.

[47661] VGAM3407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47662] VGAM3407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3407 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47663] The complementary binding of VGAM3407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3407 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47664] It is appreciated that VGAM3407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3407 host target genes. The mRNA of each one of this plurality of VGAM3407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3407 RNA, herein designated VGAM RNA, and which when bound by VGAM3407 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3407 host target proteins.

[47665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3407 gene, herein designated VGAM GENE, on one or more VGAM3407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47666] It is yet further appreciated that a function of VGAM3407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3407 include diagnosis, prevention and treatment of viral infection by Acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM3407 correlate with, and may be deduced from, the identity of the host target genes which VGAM3407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47667] Nucleotide sequences of the VGAM3407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3407 are further described hereinbelow with reference to Table 1.

[47668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47669] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3408 (VGAM3408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47670] VGAM3408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3408 was detected is described hereinabove with reference to Figs. 2-8.

[47671] VGAM3408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM3408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47672] VGAM3408 gene, herein designated VGAM GENE, encodes a VGAM3408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3408 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3408 precursor RNA is designated SEQ ID:76574, and is provided hereinbelow with reference to the sequence listing part.

[47673] VGAM3408 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47674] An enzyme complex designated DICER COMPLEX, dices the VGAM3408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3408 RNA is designated SEQ ID:76575, and is provided hereinbelow with reference to the sequence listing part.

[47675] VGAM3408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47676] VGAM3408 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3408 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47677] The complementary binding of VGAM3408 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3408 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47678] It is appreciated that VGAM3408 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3408 host target genes. The mRNA of each one of this plurality of VGAM3408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3408 RNA, herein designated VGAM RNA, and which when bound by VGAM3408 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3408 host target proteins.

[47679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3408 gene, herein designated VGAM GENE, on one or more VGAM3408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[47680] It is yet further appreciated that a function of VGAM3408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3408 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3408 correlate with, and may be deduced from, the identity of the host target genes which VGAM3408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47681] Nucleotide sequences of the VGAM3408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3408 are further described hereinbelow with reference to Table 1.

[47682] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47683] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3409 (VGAM3409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47684] VGAM3409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3409 was detected is described hereinabove with reference to Figs. 2–8.

[47685] VGAM3409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM3409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47686] VGAM3409 gene, herein designated VGAM GENE, encodes a VGAM3409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3409 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3409 precursor RNA is designated SEQ ID:76581, and is provided hereinbelow with reference to the sequence listing part.

[47687] VGAM3409 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47688] An enzyme complex designated DICER COMPLEX, dices the VGAM3409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3409 RNA is designated SEQ ID:76582, and is provided hereinbelow with reference to the sequence listing part.

[47689] VGAM3409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47690] VGAM3409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3409 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47691] The complementary binding of VGAM3409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3409 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47692] It is appreciated that VGAM3409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3409 host target genes. The mRNA of each one of this plurality of VGAM3409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3409 RNA, herein designated VGAM RNA, and which when bound by VGAM3409 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3409 host target proteins.

[47693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3409 gene, herein designated VGAM GENE, on one or more VGAM3409 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [47694] It is yet further appreciated that a function of VGAM3409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3409 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3409 correlate with, and may be deduced from, the identity of the host target genes which VGAM3409 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [47695] Nucleotide sequences of the VGAM3409 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3409 are further described hereinbelow with reference to Table 1.
- [47696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47697] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3410 (VGAM3410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47698] VGAM3410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3410 was detected is described hereinabove with reference to Figs. 2–8.

[47699] VGAM3410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow dwarf virus – MAV. VGAM3410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47700] VGAM3410 gene, herein designated VGAM GENE, encodes a VGAM3410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3410 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3410 precursor RNA is designated SEQ ID:76833, and is provided hereinbelow with reference to the sequence listing part.

[47701] VGAM3410 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47702] An enzyme complex designated DICER COMPLEX, dices the VGAM3410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3410 RNA is designated SEQ ID:76834, and is provided hereinbelow with reference to the sequence listing part.

[47703] VGAM3410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47704] VGAM3410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3410 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47705] The complementary binding of VGAM3410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3410 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47706] It is appreciated that VGAM3410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3410 host target genes. The mRNA of

each one of this plurality of VGAM3410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3410 RNA, herein designated VGAM RNA, and which when bound by VGAM3410 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3410 host target proteins.

[47707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3410 gene, herein designated VGAM GENE, on one or more VGAM3410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[47708] It is yet further appreciated that a function of VGAM3410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3410 include diagnosis, prevention and treatment of viral infection by Barley yellow dwarf virus – MAV. Specific functions, and accordingly utilities, of VGAM3410 correlate with, and may be deduced from, the identity of the host target genes which VGAM3410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47709] Nucleotide sequences of the VGAM3410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3410 are further described hereinbelow with reference to Table 1.

[47710] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3410 RNA, herein designated VGAM RNA, are de–

scribed hereinbelow with reference to Table 2.

[47711] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3411 (VGAM3411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47712] VGAM3411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3411 was detected is described hereinabove with reference to Figs. 2–8.

[47713] VGAM3411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47714] VGAM3411 gene, herein designated VGAM GENE, encodes a VGAM3411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3411 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3411 precursor RNA is designated SEQ ID:76874, and is provided hereinbelow with reference to the sequence listing part.

[47715] VGAM3411 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47716] An enzyme complex designated DICER COMPLEX, dices the VGAM3411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3411 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3411 RNA is designated SEQ ID:76875,

and is provided hereinbelow with reference to the sequence listing part.

[47717] VGAM3411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47718] VGAM3411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3411 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47719] The complementary binding of VGAM3411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3411 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47720] It is appreciated that VGAM3411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3411 host target genes. The mRNA of each one of this plurality of VGAM3411 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3411 RNA, herein designated VGAM RNA, and which when bound by VGAM3411 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3411 host target proteins.

[47721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3411 gene, herein designated VGAM GENE, on one or more VGAM3411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47722] It is yet further appreciated that a function of VGAM3411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3411 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3411 correlate with, and may be deduced from, the identity of the host target genes which VGAM3411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47723] Nucleotide sequences of the VGAM3411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3411 are further described hereinbelow with reference to Table 1.

[47724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47725] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3412 (VGAM3412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47726] VGAM3412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3412 was detected is described hereinabove with reference to Figs. 2–8.

[47727] VGAM3412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aichi virus. VGAM3412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47728] VGAM3412 gene, herein designated VGAM GENE, encodes a VGAM3412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3412 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3412 precursor RNA is designated SEQ ID:76903, and is provided

hereinbelow with reference to the sequence listing part.

[47729] VGAM3412 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47730] An enzyme complex designated DICER COMPLEX, dices the VGAM3412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3412 RNA is designated SEQ ID:76904, and is provided hereinbelow with reference to the sequence listing part.

[47731] VGAM3412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47732] VGAM3412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3412 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3412 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47733] The complementary binding of VGAM3412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3412 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47734] It is appreciated that VGAM3412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3412 host target genes. The mRNA of each one of this plurality of VGAM3412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3412 RNA, herein designated VGAM RNA, and which when bound by VGAM3412 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3412 host target proteins.

[47735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3412 gene, herein designated VGAM GENE, on one or more VGAM3412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47736] It is yet further appreciated that a function of VGAM3412 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3412 include diagnosis, prevention and treatment of viral infection by Aichi virus. Specific functions, and accordingly utilities, of VGAM3412 correlate with, and may be deduced from, the identity of the host target genes which VGAM3412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47737] Nucleotide sequences of the VGAM3412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3412 are further described hereinbelow with reference to Table 1.

[47738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47739] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3413 (VGAM3413) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47740] VGAM3413 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3413 was detected is described hereinabove with reference to Figs. 2–8.

[47741] VGAM3413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM3413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47742] VGAM3413 gene, herein designated VGAM GENE, encodes a VGAM3413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3413 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3413 precursor RNA is designated SEQ ID:76935, and is provided hereinbelow with reference to the sequence listing part.

[47743] VGAM3413 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47744] An enzyme complex designated DICER COMPLEX, dices the VGAM3413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3413 RNA is designated SEQ ID:76936, and is provided hereinbelow with reference to the sequence listing part.

[47745] VGAM3413 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47746] VGAM3413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3413 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3413 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47747] The complementary binding of VGAM3413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3413 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47748] It is appreciated that VGAM3413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3413 host target genes. The mRNA of each one of this plurality of VGAM3413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3413 RNA, herein designated VGAM

RNA, and which when bound by VGAM3413 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3413 host target proteins.

[47749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3413 gene, herein designated VGAM GENE, on one or more VGAM3413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47750] It is yet further appreciated that a function of VGAM3413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3413 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3413 correlate with, and may be deduced from, the identity of the host target genes which VGAM3413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47751] Nucleotide sequences of the VGAM3413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3413 are further described hereinbelow with reference to Table 1.

[47752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47753] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3414 (VGAM3414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47754] VGAM3414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3414 was detected is described hereinabove with reference to Figs. 2-8.

[47755] VGAM3414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM3414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47756] VGAM3414 gene, herein designated VGAM GENE, encodes a VGAM3414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3414 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3414 precursor RNA is designated SEQ ID:76940, and is provided hereinbelow with reference to the sequence listing part.

[47757] VGAM3414 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47758] An enzyme complex designated DICER COMPLEX, dices the VGAM3414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3414 RNA is designated SEQ ID:76941, and is provided hereinbelow with reference to the sequence listing part.

[47759] VGAM3414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3414 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47760] VGAM3414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3414 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3414 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47761] The complementary binding of VGAM3414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3414 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47762] It is appreciated that VGAM3414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3414 host target genes. The mRNA of each one of this plurality of VGAM3414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3414 RNA, herein designated VGAM RNA, and which when bound by VGAM3414 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3414 host target proteins.

[47763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3414 gene, herein designated VGAM GENE, on one or more VGAM3414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47764] It is yet further appreciated that a function of VGAM3414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3414 include diagnosis, prevention and

treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM3414 correlate with, and may be deduced from, the identity of the host target genes which VGAM3414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47765] Nucleotide sequences of the VGAM3414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3414 are further described hereinbelow with reference to Table 1.

[47766] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47767] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3415 (VGAM3415) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47768] VGAM3415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3415 was detected is described hereinabove with reference to Figs. 2–8.

[47769] VGAM3415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM3415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47770] VGAM3415 gene, herein designated VGAM GENE, encodes a VGAM3415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3415 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3415 precursor RNA is designated SEQ ID:76946, and is provided hereinbelow with reference to the sequence listing part.

[47771] VGAM3415 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3415 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47772] An enzyme complex designated DICER COMPLEX, dices the VGAM3415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3415 RNA is designated SEQ ID:76947, and is provided hereinbelow with reference to the sequence listing part.

[47773] VGAM3415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3415 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3415 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47774] VGAM3415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3415 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3415 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47775] The complementary binding of VGAM3415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3415 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47776] It is appreciated that VGAM3415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3415 host target genes. The mRNA of each one of this plurality of VGAM3415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3415 RNA, herein designated VGAM RNA, and which when bound by VGAM3415 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3415 host target proteins.

[47777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3415 gene, herein designated VGAM GENE, on one or more VGAM3415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47778] It is yet further appreciated that a function of VGAM3415 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3415 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus.

Specific functions, and accordingly utilities, of VGAM3415 correlate with, and may be deduced from, the identity of the host target genes which VGAM3415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47779] Nucleotide sequences of the VGAM3415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3415 are further described hereinbelow with reference to Table 1.

[47780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47781] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3416 (VGAM3416) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[47782] VGAM3416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3416 was detected is described hereinabove with reference to Figs. 2–8.

[47783] VGAM3416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM3416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47784] VGAM3416 gene, herein designated VGAM GENE, encodes a VGAM3416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3416 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3416 precursor RNA is designated SEQ ID:76958, and is provided hereinbelow with reference to the sequence listing part.

[47785] VGAM3416 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3416 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47786] An enzyme complex designated DICER COMPLEX, dices the VGAM3416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3416 RNA is designated SEQ ID:76959, and is provided hereinbelow with reference to the sequence listing part.

[47787] VGAM3416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3416 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47788] VGAM3416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3416 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47789] The complementary binding of VGAM3416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3416 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47790] It is appreciated that VGAM3416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3416 host target genes. The mRNA of each one of this plurality of VGAM3416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3416 RNA, herein designated VGAM RNA, and which when bound by VGAM3416 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3416 host target proteins.

[47791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3416 gene, herein designated VGAM GENE, on one or more VGAM3416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47792] It is yet further appreciated that a function of VGAM3416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3416 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM3416

correlate with, and may be deduced from, the identity of the host target genes which VGAM3416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47793] Nucleotide sequences of the VGAM3416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3416 are further described hereinbelow with reference to Table 1.

[47794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47795] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3417 (VGAM3417) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[47796] VGAM3417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3417 was detected is described hereinabove with reference to Figs. 2–8.

[47797] VGAM3417 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47798] VGAM3417 gene, herein designated VGAM GENE, encodes a VGAM3417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3417 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3417 precursor RNA is designated SEQ ID:76984, and is provided hereinbelow with reference to the sequence listing part.

[47799] VGAM3417 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47800] An enzyme complex designated DICER COMPLEX, dices the VGAM3417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3417 RNA is designated SEQ ID:76985, and is provided hereinbelow with reference to the sequence listing part.

[47801] VGAM3417 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47802] VGAM3417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3417 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3417 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47803] The complementary binding of VGAM3417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3417 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47804] It is appreciated that VGAM3417 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3417 host target genes. The mRNA of each one of this plurality of VGAM3417 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3417 RNA, herein designated VGAM RNA, and which when bound by VGAM3417 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3417 host target proteins.

[47805] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3417 gene, herein designated VGAM GENE, on one or more VGAM3417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47806] It is yet further appreciated that a function of VGAM3417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3417 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3417 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47807] Nucleotide sequences of the VGAM3417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3417 are further described hereinbelow with reference to Table 1.

[47808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47809] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3418 (VGAM3418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47810] VGAM3418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3418 was detected is described hereinabove with reference to Figs. 2–8.

[47811] VGAM3418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47812] VGAM3418 gene, herein designated VGAM GENE, encodes a VGAM3418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3418 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3418 precursor RNA is designated SEQ ID:76987, and is provided hereinbelow with reference to the sequence listing part.

[47813] VGAM3418 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47814] An enzyme complex designated DICER COMPLEX, dices the VGAM3418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3418 RNA is designated SEQ ID:76988, and is provided hereinbelow with reference to the sequence listing part.

[47815] VGAM3418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47816] VGAM3418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3418 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47817] The complementary binding of VGAM3418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3418 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47818] It is appreciated that VGAM3418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3418 host target genes. The mRNA of each one of this plurality of VGAM3418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3418 RNA, herein designated VGAM RNA, and which when bound by VGAM3418 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3418 host target proteins.

[47819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3418 gene, herein designated VGAM GENE, on one or more VGAM3418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47820] It is yet further appreciated that a function of VGAM3418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3418 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3418 correlate with, and may be deduced from, the identity of the host target genes which VGAM3418 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[47821] Nucleotide sequences of the VGAM3418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3418 are further described hereinbelow with reference to Table 1.

[47822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47823] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3419 (VGAM3419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47824] VGAM3419 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3419 was detected is described hereinabove with reference to Figs. 2–8.

[47825] VGAM3419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM3419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47826] VGAM3419 gene, herein designated VGAM GENE, encodes a VGAM3419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3419 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3419 precursor RNA is designated SEQ ID:77010, and is provided hereinbelow with reference to the sequence listing part.

[47827] VGAM3419 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47828] An enzyme complex designated DICER COMPLEX, dices the VGAM3419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3419 RNA is designated SEQ ID:77011, and is provided hereinbelow with reference to the sequence listing part.

[47829] VGAM3419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47830] VGAM3419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3419 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[47831] The complementary binding of VGAM3419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3419 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47832] It is appreciated that VGAM3419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3419 host target genes. The mRNA of each one of this plurality of VGAM3419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3419 RNA, herein designated VGAM RNA, and which when bound by VGAM3419 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3419 host target proteins.

[47833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3419 gene, herein designated VGAM GENE, on one or more VGAM3419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47834] It is yet further appreciated that a function of VGAM3419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3419 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3419 correlate with, and may be deduced from, the identity of the host target genes which VGAM3419 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[47835] Nucleotide sequences of the VGAM3419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3419 are further described hereinbelow with reference to Table 1.

[47836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47837] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3420 (VGAM3420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47838] VGAM3420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3420 was detected is described hereinabove with reference to Figs. 2–8.

[47839] VGAM3420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum mosaic virus. VGAM3420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47840] VGAM3420 gene, herein designated VGAM GENE, encodes a VGAM3420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3420 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3420 precursor RNA is designated SEQ ID:77022, and is provided hereinbelow with reference to the sequence listing part.

[47841] VGAM3420 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47842] An enzyme complex designated DICER COMPLEX, dices the VGAM3420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3420 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3420 RNA is designated SEQ ID:77023, and is provided hereinbelow with reference to the sequence listing part.

[47843] VGAM3420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[47844] VGAM3420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3420 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47845] The complementary binding of VGAM3420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3420 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3420 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47846] It is appreciated that VGAM3420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3420 host target genes. The mRNA of each one of this plurality of VGAM3420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3420 RNA, herein designated VGAM RNA, and which when bound by VGAM3420 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3420 host target proteins.

[47847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3420 gene, herein designated VGAM GENE, on one

or more VGAM3420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47848] It is yet further appreciated that a function of VGAM3420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3420 include diagnosis, prevention and treatment of viral infection by Sorghum mosaic virus. Specific functions, and accordingly utilities, of VGAM3420 correlate with, and may be deduced from, the identity of the host target genes which VGAM3420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47849] Nucleotide sequences of the VGAM3420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3420 are further described hereinbelow with reference to Table 1.

[47850] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47851] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3421 (VGAM3421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47852] VGAM3421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3421 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[47853] VGAM3421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum mosaic virus. VGAM3421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47854] VGAM3421 gene, herein designated VGAM GENE, encodes a VGAM3421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3421 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3421 precursor RNA is designated SEQ ID:77036, and is provided hereinbelow with reference to the sequence listing part.

[47855] VGAM3421 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47856] An enzyme complex designated DICER COMPLEX, dices the VGAM3421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3421 RNA is designated SEQ ID:77037, and is provided hereinbelow with reference to the sequence listing part.

[47857] VGAM3421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47858] VGAM3421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3421 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47859] The complementary binding of VGAM3421 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3421 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47860] It is appreciated that VGAM3421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3421 host target genes. The mRNA of each one of this plurality of VGAM3421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3421 RNA, herein designated VGAM RNA, and which when bound by VGAM3421 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3421 host target proteins.

[47861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3421 gene, herein designated VGAM GENE, on one or more VGAM3421 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47862] It is yet further appreciated that a function of VGAM3421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3421 include diagnosis, prevention and treatment of viral infection by Sorghum mosaic virus. Specific functions, and accordingly utilities, of VGAM3421 correlate with, and may be deduced from, the identity of the host target genes which VGAM3421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47863] Nucleotide sequences of the VGAM3421 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3421 are further described hereinbelow with reference to Table 1.

[47864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3421 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47865] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3422 (VGAM3422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47866] VGAM3422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3422 was detected is described hereinabove with reference to Figs. 2-8.

[47867] VGAM3422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47868] VGAM3422 gene, herein designated VGAM GENE, encodes a VGAM3422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3422 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3422 precursor RNA is designated SEQ ID:77046, and is provided hereinbelow with reference to the sequence listing part.

[47869] VGAM3422 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[47870] An enzyme complex designated DICER COMPLEX, dices the VGAM3422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3422 RNA is designated SEQ ID:77047, and is provided hereinbelow with reference to the sequence listing part.

[47871] VGAM3422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47872] VGAM3422 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3422 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47873] The complementary binding of VGAM3422 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3422 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47874] It is appreciated that VGAM3422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3422 host target genes. The mRNA of each one of this plurality of VGAM3422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3422 RNA, herein designated VGAM RNA, and which when bound by VGAM3422 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3422 host target proteins.

[47875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3422 gene, herein designated VGAM GENE, on one or more VGAM3422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47876] It is yet further appreciated that a function of VGAM3422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3422 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3422 correlate with, and may be deduced from, the identity of the host target genes which VGAM3422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47877] Nucleotide sequences of the VGAM3422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3422 are further described hereinbelow with reference to Table 1.

[47878] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47879] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3423 (VGAM3423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47880] VGAM3423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3423 was detected is described hereinabove with reference to Figs. 2-8.

[47881] VGAM3423 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Alcelaphine herpesvirus 1. VGAM3423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47882] VGAM3423 gene, herein designated VGAM GENE, encodes a VGAM3423 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3423 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3423 precursor RNA is designated SEQ ID:77050, and is provided hereinbelow with reference to the sequence listing part.

[47883] VGAM3423 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47884] An enzyme complex designated DICER COMPLEX, dices the VGAM3423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3423 RNA is designated SEQ ID:77051, and is provided hereinbelow with reference to the sequence listing part.

[47885] VGAM3423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3423 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47886] VGAM3423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3423 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47887] The complementary binding of VGAM3423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3423 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3423 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47888] It is appreciated that VGAM3423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3423 host target genes. The mRNA of each one of this plurality of VGAM3423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3423 RNA, herein designated VGAM RNA, and which when bound by VGAM3423 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3423 host target proteins.

[47889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3423 gene, herein designated VGAM GENE, on one or more VGAM3423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47890] It is yet further appreciated that a function of VGAM3423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3423 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3423 correlate with, and may be deduced from, the identity of the host target genes which VGAM3423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47891] Nucleotide sequences of the VGAM3423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3423 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3423 are further described hereinbelow with reference to Table 1.

[47892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47893] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3424 (VGAM3424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47894] VGAM3424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3424 was detected is described hereinabove with reference to Figs. 2-8.

[47895] VGAM3424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4.

VGAM3424 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47896] VGAM3424 gene, herein designated VGAM GENE, encodes a VGAM3424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3424 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3424 precursor RNA is designated SEQ ID:77074, and is provided hereinbelow with reference to the sequence listing part.

[47897] VGAM3424 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47898] An enzyme complex designated DICER COMPLEX, dices

the VGAM3424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3424 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3424 RNA is designated SEQ ID:77075, and is provided hereinbelow with reference to the sequence listing part.

[47899] VGAM3424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3424 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47900] VGAM3424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3424 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3424 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47901] The complementary binding of VGAM3424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3424 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3424 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47902] It is appreciated that VGAM3424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3424 host target genes. The mRNA of each one of this plurality of VGAM3424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3424 RNA, herein designated VGAM RNA, and which when bound by VGAM3424 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3424 host target proteins.

[47903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3424 gene, herein designated VGAM GENE, on one or more VGAM3424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47904] It is yet further appreciated that a function of VGAM3424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3424 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3424 correlate with, and may be deduced from, the identity of the host target genes which VGAM3424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47905] Nucleotide sequences of the VGAM3424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3424 are further described hereinbelow with reference to Table 1.

[47906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47907] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3425 (VGAM3425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47908] VGAM3425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3425 was detected is described hereinabove with reference to Figs. 2-8.

[47909] VGAM3425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3425 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[47910] VGAM3425 gene, herein designated VGAM GENE, encodes a VGAM3425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3425 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3425 precursor RNA is designated SEQ ID:77080, and is provided hereinbelow with reference to the sequence listing part.

[47911] VGAM3425 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47912] An enzyme complex designated DICER COMPLEX, dices the VGAM3425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3425 RNA is designated SEQ ID:77081, and is provided hereinbelow with reference to the sequence listing part.

[47913] VGAM3425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3425 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47914] VGAM3425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3425 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47915] The complementary binding of VGAM3425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3425 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3425 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47916] It is appreciated that VGAM3425 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3425 host target genes. The mRNA of each one of this plurality of VGAM3425 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3425 RNA, herein designated VGAM RNA, and which when bound by VGAM3425 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3425 host target proteins.

[47917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3425 gene, herein designated VGAM GENE, on one or more VGAM3425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47918] It is yet further appreciated that a function of VGAM3425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3425 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3425 correlate with, and may be deduced from, the identity of the host target genes which VGAM3425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47919] Nucleotide sequences of the VGAM3425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3425 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3425 are further described hereinbelow with reference to Table 1.

[47920] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47921] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3426 (VGAM3426) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47922] VGAM3426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3426 was detected is described hereinabove with reference to Figs. 2-8.

[47923] VGAM3426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1.

VGAM3426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47924] VGAM3426 gene, herein designated VGAM GENE, encodes a VGAM3426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3426 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3426 precursor RNA is designated SEQ ID:77091, and is provided hereinbelow with reference to the sequence listing part.

[47925] VGAM3426 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47926] An enzyme complex designated DICER COMPLEX, dices

the VGAM3426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3426 RNA is designated SEQ ID:77092, and is provided hereinbelow with reference to the sequence listing part.

[47927] VGAM3426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3426 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47928] VGAM3426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3426 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3426 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47929] The complementary binding of VGAM3426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3426 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47930] It is appreciated that VGAM3426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3426 host target genes. The mRNA of each one of this plurality of VGAM3426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3426 RNA, herein designated VGAM RNA, and which when bound by VGAM3426 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3426 host target proteins.

[47931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3426 gene, herein designated VGAM GENE, on one or more VGAM3426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47932] It is yet further appreciated that a function of VGAM3426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3426 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3426 correlate with, and may be deduced from, the identity of the host target genes which VGAM3426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47933] Nucleotide sequences of the VGAM3426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3426 are further described hereinbelow with reference to Table 1.

[47934] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47935] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3427 (VGAM3427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47936] VGAM3427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3427 was detected is described hereinabove with reference to Figs. 2-8.

[47937] VGAM3427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3427 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[47938] VGAM3427 gene, herein designated VGAM GENE, encodes a VGAM3427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3427 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3427 precursor RNA is designated SEQ ID:77094, and is provided hereinbelow with reference to the sequence listing part.

[47939] VGAM3427 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47940] An enzyme complex designated DICER COMPLEX, dices the VGAM3427 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3427 RNA is designated SEQ ID:77095, and is provided hereinbelow with reference to the sequence listing part.

[47941] VGAM3427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3427 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47942] VGAM3427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3427 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3427 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47943] The complementary binding of VGAM3427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3427

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47944] It is appreciated that VGAM3427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3427 host target genes. The mRNA of each one of this plurality of VGAM3427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3427 RNA, herein designated VGAM RNA, and which when bound by VGAM3427 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3427 host target proteins.

[47945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3427 gene, herein designated VGAM GENE, on one or more VGAM3427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47946] It is yet further appreciated that a function of VGAM3427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3427 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3427 correlate with, and may be deduced from, the identity of the host target genes which VGAM3427 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47947] Nucleotide sequences of the VGAM3427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3427 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3427 are further described hereinbelow with reference to Table 1.

[47948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47949] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3428 (VGAM3428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47950] VGAM3428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3428 was detected is described hereinabove with reference to Figs. 2-8.

[47951] VGAM3428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[47952] VGAM3428 gene, herein designated VGAM GENE, encodes a VGAM3428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3428 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3428 precursor RNA is designated SEQ ID:77101, and is provided hereinbelow with reference to the sequence listing part.

[47953] VGAM3428 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47954] An enzyme complex designated DICER COMPLEX, dices the VGAM3428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3428 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3428 RNA is designated SEQ ID:77102, and is provided hereinbelow with reference to the sequence listing part.

[47955] VGAM3428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3428 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47956] VGAM3428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3428 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47957] The complementary binding of VGAM3428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3428 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47958] It is appreciated that VGAM3428 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3428 host target genes. The mRNA of each one of this plurality of VGAM3428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3428 RNA, herein designated VGAM RNA, and which when bound by VGAM3428 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3428 host target proteins.

[47959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3428 gene, herein designated VGAM GENE, on one or more VGAM3428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47960] It is yet further appreciated that a function of VGAM3428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3428 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3428 correlate with, and may be deduced from, the identity of the host target genes which VGAM3428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47961] Nucleotide sequences of the VGAM3428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3428 are further

described hereinbelow with reference to Table 1.

[47962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47963] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3429 (VGAM3429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47964] VGAM3429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3429 was detected is described hereinabove with reference to Figs. 2-8.

[47965] VGAM3429 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47966] VGAM3429 gene, herein designated VGAM GENE, encodes a VGAM3429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3429 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3429 precursor RNA is designated SEQ ID:77140, and is provided hereinbelow with reference to the sequence listing part.

[47967] VGAM3429 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47968] An enzyme complex designated DICER COMPLEX, dices the VGAM3429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3429 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3429 RNA is designated SEQ ID:77141, and is provided hereinbelow with reference to the sequence listing part.

[47969] VGAM3429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47970] VGAM3429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3429 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47971] The complementary binding of VGAM3429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3429 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3429 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47972] It is appreciated that VGAM3429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3429 host target genes. The mRNA of each one of this plurality of VGAM3429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3429 RNA, herein designated VGAM RNA, and which when bound by VGAM3429 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3429 host target proteins.

[47973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3429 gene, herein designated VGAM GENE, on one or more VGAM3429 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47974] It is yet further appreciated that a function of VGAM3429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3429 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3429 correlate with, and may be deduced from, the identity of the host target genes which VGAM3429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47975] Nucleotide sequences of the VGAM3429 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3429 are further described hereinbelow with reference to Table 1.

[47976] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47977] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3430 (VGAM3430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47978] VGAM3430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3430 was detected is described hereinabove with reference to Figs. 2-8.

[47979] VGAM3430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM3430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47980] VGAM3430 gene, herein designated VGAM GENE, encodes

a VGAM3430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3430 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3430 precursor RNA is designated SEQ ID:77151, and is provided hereinbelow with reference to the sequence listing part.

[47981] VGAM3430 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47982] An enzyme complex designated DICER COMPLEX, dices the VGAM3430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3430 RNA is designated SEQ ID:77152, and is provided hereinbelow with reference to the sequence listing part.

[47983] VGAM3430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47984] VGAM3430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3430 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47985] The complementary binding of VGAM3430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3430 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[47986] It is appreciated that VGAM3430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3430 host target genes. The mRNA of each one of this plurality of VGAM3430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3430 RNA, herein designated VGAM RNA, and which when bound by VGAM3430 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3430 host target proteins.

[47987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3430 gene, herein designated VGAM GENE, on one or more VGAM3430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[47988] It is yet further appreciated that a function of VGAM3430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3430 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM3430 correlate with, and may be deduced from, the identity of the host target genes which VGAM3430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47989] Nucleotide sequences of the VGAM3430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3430 are further described hereinbelow with reference to Table 1.

[47990] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47991] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3431 (VGAM3431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47992] VGAM3431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3431 was detected is described hereinabove with reference to Figs. 2-8.

[47993] VGAM3431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Indian citrus ringspot virus. VGAM3431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47994] VGAM3431 gene, herein designated VGAM GENE, encodes a VGAM3431 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3431 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3431 precursor RNA is designated SEQ ID:77155, and is provided hereinbelow with reference to the sequence listing part.

[47995] VGAM3431 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47996] An enzyme complex designated DICER COMPLEX, dices the VGAM3431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3431 RNA is designated SEQ ID:77156, and is provided hereinbelow with reference to the sequence listing part.

[47997] VGAM3431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[47998] VGAM3431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3431 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[47999] The complementary binding of VGAM3431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3431 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48000] It is appreciated that VGAM3431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3431 host target genes. The mRNA of each one of this plurality of VGAM3431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3431 RNA, herein designated VGAM RNA, and which when bound by VGAM3431 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3431 host target proteins.

[48001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3431 gene, herein designated VGAM GENE, on one or more VGAM3431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48002] It is yet further appreciated that a function of VGAM3431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3431 include diagnosis, prevention and treatment of viral infection by Indian citrus ringspot virus. Specific functions, and accordingly utilities, of VGAM3431 correlate with, and may be deduced from, the identity of the host target genes which VGAM3431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48003] Nucleotide sequences of the VGAM3431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3431 are further described hereinbelow with reference to Table 1.

[48004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48005] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3432 (VGAM3432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48006] VGAM3432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3432 was detected is described hereinabove with reference to Figs. 2-8.

[48007] VGAM3432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48008] VGAM3432 gene, herein designated VGAM GENE, encodes a VGAM3432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3432 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3432 precursor RNA is designated SEQ ID:77167, and is provided hereinbelow with reference to the sequence listing part.

[48009] VGAM3432 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48010] An enzyme complex designated DICER COMPLEX, dices the VGAM3432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3432 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3432 RNA is designated SEQ ID:77168, and is provided hereinbelow with reference to the sequence listing part.

[48011] VGAM3432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48012] VGAM3432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3432 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48013] The complementary binding of VGAM3432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3432 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48014] It is appreciated that VGAM3432 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3432 host target genes. The mRNA of each one of this plurality of VGAM3432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3432 RNA, herein designated VGAM RNA, and which when bound by VGAM3432 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3432 host target proteins.

[48015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3432 gene, herein designated VGAM GENE, on one or more VGAM3432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48016] It is yet further appreciated that a function of VGAM3432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3432 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3432 correlate with, and may be deduced from, the identity of the host target genes which VGAM3432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48017] Nucleotide sequences of the VGAM3432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3432 are further described hereinbelow with reference to Table 1.

[48018] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48019] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3433 (VGAM3433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48020] VGAM3433 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3433 was detected is described hereinabove with reference to Figs. 2–8.

[48021] VGAM3433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48022] VGAM3433 gene, herein designated VGAM GENE, encodes a VGAM3433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3433 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3433 precursor RNA is designated SEQ ID:77173, and is provided hereinbelow with reference to the sequence listing part.

[48023] VGAM3433 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48024] An enzyme complex designated DICER COMPLEX, dices the VGAM3433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3433 RNA is designated SEQ ID:77174, and is provided hereinbelow with reference to the sequence listing part.

[48025] VGAM3433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48026] VGAM3433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3433 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48027] The complementary binding of VGAM3433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3433 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48028] It is appreciated that VGAM3433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3433 host target genes. The mRNA of each one of this plurality of VGAM3433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3433 RNA, herein designated VGAM RNA, and which when bound by VGAM3433 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3433 host target proteins.

[48029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3433 gene, herein designated VGAM GENE, on one or more VGAM3433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [48030] It is yet further appreciated that a function of VGAM3433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3433 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3433 correlate with, and may be deduced from, the identity of the host target genes which VGAM3433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [48031] Nucleotide sequences of the VGAM3433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3433 are further described hereinbelow with reference to Table 1.
- [48032] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48033] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3434 (VGAM3434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48034] VGAM3434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3434 was detected is described hereinabove with reference to Figs. 2-8.

[48035] VGAM3434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48036] VGAM3434 gene, herein designated VGAM GENE, encodes a VGAM3434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3434 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3434 precursor RNA is designated SEQ ID:77177, and is provided hereinbelow with reference to the sequence listing part.

[48037] VGAM3434 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48038] An enzyme complex designated DICER COMPLEX, dices the VGAM3434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3434 RNA is designated SEQ ID:77178, and is provided hereinbelow with reference to the sequence listing part.

[48039] VGAM3434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48040] VGAM3434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3434 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48041] The complementary binding of VGAM3434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3434 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48042] It is appreciated that VGAM3434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3434 host target genes. The mRNA of

each one of this plurality of VGAM3434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3434 RNA, herein designated VGAM RNA, and which when bound by VGAM3434 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3434 host target proteins.

[48043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3434 gene, herein designated VGAM GENE, on one or more VGAM3434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[48044] It is yet further appreciated that a function of VGAM3434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3434 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3434 correlate with, and may be deduced from, the identity of the host target genes which VGAM3434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48045] Nucleotide sequences of the VGAM3434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3434 are further described hereinbelow with reference to Table 1.

[48046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3434 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[48047] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3435 (VGAM3435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48048] VGAM3435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3435 was detected is described hereinabove with reference to Figs. 2–8.

[48049] VGAM3435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM3435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48050] VGAM3435 gene, herein designated VGAM GENE, encodes a VGAM3435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3435 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3435 precursor RNA is designated SEQ ID:77183, and is provided hereinbelow with reference to the sequence listing part.

[48051] VGAM3435 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48052] An enzyme complex designated DICER COMPLEX, dices the VGAM3435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3435 RNA is designated SEQ ID:77184,

and is provided hereinbelow with reference to the sequence listing part.

[48053] VGAM3435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48054] VGAM3435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3435 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48055] The complementary binding of VGAM3435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3435 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48056] It is appreciated that VGAM3435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3435 host target genes. The mRNA of each one of this plurality of VGAM3435 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3435 RNA, herein designated VGAM RNA, and which when bound by VGAM3435 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3435 host target proteins.

[48057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3435 gene, herein designated VGAM GENE, on one or more VGAM3435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48058] It is yet further appreciated that a function of VGAM3435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3435 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM3435 correlate with, and may be deduced from, the identity of the host target genes which VGAM3435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48059] Nucleotide sequences of the VGAM3435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3435 are further described hereinbelow with reference to Table 1.

[48060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48061] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3436 (VGAM3436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48062] VGAM3436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3436 was detected is described hereinabove with reference to Figs. 2–8.

[48063] VGAM3436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM3436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48064] VGAM3436 gene, herein designated VGAM GENE, encodes a VGAM3436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3436 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3436 precu-

sor RNA is designated SEQ ID:77195, and is provided hereinbelow with reference to the sequence listing part.

[48065] VGAM3436 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48066] An enzyme complex designated DICER COMPLEX, dices the VGAM3436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3436 RNA is designated SEQ ID:77196, and is provided hereinbelow with reference to the se-

quence listing part.

[48067] VGAM3436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48068] VGAM3436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3436 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48069] The complementary binding of VGAM3436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3436 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48070] It is appreciated that VGAM3436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3436 host target genes. The mRNA of each one of this plurality of VGAM3436 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3436 RNA, herein designated VGAM RNA, and which when bound by VGAM3436 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3436 host target proteins.

[48071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3436 gene, herein designated VGAM GENE, on one or more VGAM3436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48072] It is yet further appreciated that a function of VGAM3436

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3436 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM3436 correlate with, and may be deduced from, the identity of the host target genes which VGAM3436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48073] Nucleotide sequences of the VGAM3436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3436 are further described hereinbelow with reference to Table 1.

[48074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48075] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3437 (VGAM3437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48076] VGAM3437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3437 was detected is described hereinabove with reference to Figs. 2–8.

[48077] VGAM3437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barmah Forest virus. VGAM3437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48078] VGAM3437 gene, herein designated VGAM GENE, encodes a VGAM3437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3437 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3437 precursor RNA is designated SEQ ID:77199, and is provided

hereinbelow with reference to the sequence listing part.

[48079] VGAM3437 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48080] An enzyme complex designated DICER COMPLEX, dices the VGAM3437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3437 RNA is designated SEQ ID:77200, and is provided hereinbelow with reference to the sequence listing part.

[48081] VGAM3437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48082] VGAM3437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3437 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3437 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48083] The complementary binding of VGAM3437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3437 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48084] It is appreciated that VGAM3437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3437 host target genes. The mRNA of each one of this plurality of VGAM3437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3437 RNA, herein designated VGAM RNA, and which when bound by VGAM3437 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3437 host target proteins.

[48085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3437 gene, herein designated VGAM GENE, on one or more VGAM3437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48086] It is yet further appreciated that a function of VGAM3437 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3437 include diagnosis, prevention and treatment of viral infection by Barmah Forest virus. Specific functions, and accordingly utilities, of VGAM3437 correlate with, and may be deduced from, the identity of the host target genes which VGAM3437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48087] Nucleotide sequences of the VGAM3437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3437 are further described hereinbelow with reference to Table 1.

[48088] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48089] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3438 (VGAM3438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48090] VGAM3438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3438 was detected is described hereinabove with reference to Figs. 2–8.

[48091] VGAM3438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48092] VGAM3438 gene, herein designated VGAM GENE, encodes a VGAM3438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3438 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3438 precursor RNA is designated SEQ ID:77212, and is provided hereinbelow with reference to the sequence listing part.

[48093] VGAM3438 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48094] An enzyme complex designated DICER COMPLEX, dices the VGAM3438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3438 RNA is designated SEQ ID:77213, and is provided hereinbelow with reference to the sequence listing part.

[48095] VGAM3438 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48096] VGAM3438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3438 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3438 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48097] The complementary binding of VGAM3438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3438 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3438 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48098] It is appreciated that VGAM3438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3438 host target genes. The mRNA of each one of this plurality of VGAM3438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3438 RNA, herein designated VGAM

RNA, and which when bound by VGAM3438 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3438 host target proteins.

[48099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3438 gene, herein designated VGAM GENE, on one or more VGAM3438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48100] It is yet further appreciated that a function of VGAM3438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3438 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3438 correlate with, and may be deduced from, the identity of the host target genes which VGAM3438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48101] Nucleotide sequences of the VGAM3438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3438 are further described hereinbelow with reference to Table 1.

[48102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48103] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3439 (VGAM3439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48104] VGAM3439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3439 was detected is described hereinabove with reference to Figs. 2-8.

[48105] VGAM3439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48106] VGAM3439 gene, herein designated VGAM GENE, encodes a VGAM3439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3439 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3439 precursor RNA is designated SEQ ID:77234, and is provided hereinbelow with reference to the sequence listing part.

[48107] VGAM3439 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48108] An enzyme complex designated DICER COMPLEX, dices the VGAM3439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3439 RNA is designated SEQ ID:77235, and is provided hereinbelow with reference to the sequence listing part.

[48109] VGAM3439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3439 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48110] VGAM3439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3439 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3439 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48111] The complementary binding of VGAM3439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3439 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48112] It is appreciated that VGAM3439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3439 host target genes. The mRNA of each one of this plurality of VGAM3439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3439 RNA, herein designated VGAM RNA, and which when bound by VGAM3439 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3439 host target proteins.

[48113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3439 gene, herein designated VGAM GENE, on one or more VGAM3439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48114] It is yet further appreciated that a function of VGAM3439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3439 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3439 correlate with, and may be deduced from, the identity of the host target genes which VGAM3439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48115] Nucleotide sequences of the VGAM3439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3439 are further described hereinbelow with reference to Table 1.

[48116] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48117] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3440 (VGAM3440) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48118] VGAM3440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3440 was detected is described hereinabove with reference to Figs. 2–8.

[48119] VGAM3440 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48120] VGAM3440 gene, herein designated VGAM GENE, encodes a VGAM3440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3440 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3440 precursor RNA is designated SEQ ID:77243, and is provided hereinbelow with reference to the sequence listing part.

[48121] VGAM3440 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3440 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48122] An enzyme complex designated DICER COMPLEX, dices the VGAM3440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3440 RNA is designated SEQ ID:77244, and is provided hereinbelow with reference to the sequence listing part.

[48123] VGAM3440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3440 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3440 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48124] VGAM3440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3440 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3440 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48125] The complementary binding of VGAM3440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3440 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3440 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48126] It is appreciated that VGAM3440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3440 host target genes. The mRNA of each one of this plurality of VGAM3440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3440 RNA, herein designated VGAM RNA, and which when bound by VGAM3440 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3440 host target proteins.

[48127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3440 gene, herein designated VGAM GENE, on one or more VGAM3440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48128] It is yet further appreciated that a function of VGAM3440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3440 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific

functions, and accordingly utilities, of VGAM3440 correlate with, and may be deduced from, the identity of the host target genes which VGAM3440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48129] Nucleotide sequences of the VGAM3440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3440 are further described hereinbelow with reference to Table 1.

[48130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48131] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3441 (VGAM3441) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[48132] VGAM3441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3441 was detected is described hereinabove with reference to Figs. 2–8.

[48133] VGAM3441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM3441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48134] VGAM3441 gene, herein designated VGAM GENE, encodes a VGAM3441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3441 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3441 precursor RNA is designated SEQ ID:77265, and is provided hereinbelow with reference to the sequence listing part.

[48135] VGAM3441 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3441 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48136] An enzyme complex designated DICER COMPLEX, dices the VGAM3441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3441 RNA is designated SEQ ID:77266, and is provided hereinbelow with reference to the sequence listing part.

[48137] VGAM3441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3441 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48138] VGAM3441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3441 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48139] The complementary binding of VGAM3441 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3441 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48140] It is appreciated that VGAM3441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3441 host target genes. The mRNA of each one of this plurality of VGAM3441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3441 RNA, herein designated VGAM RNA, and which when bound by VGAM3441 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3441 host target proteins.

[48141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3441 gene, herein designated VGAM GENE, on one or more VGAM3441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48142] It is yet further appreciated that a function of VGAM3441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3441 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of

VGAM3441 correlate with, and may be deduced from, the identity of the host target genes which VGAM3441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48143] Nucleotide sequences of the VGAM3441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3441 are further described hereinbelow with reference to Table 1.

[48144] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48145] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3442 (VGAM3442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[48146] VGAM3442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3442 was detected is described hereinabove with reference to Figs. 2–8.

[48147] VGAM3442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM3442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48148] VGAM3442 gene, herein designated VGAM GENE, encodes a VGAM3442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3442 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3442 precursor RNA is designated SEQ ID:77291, and is provided hereinbelow with reference to the sequence listing part.

[48149] VGAM3442 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48150] An enzyme complex designated DICER COMPLEX, dices the VGAM3442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3442 RNA is designated SEQ ID:77292, and is provided hereinbelow with reference to the sequence listing part.

[48151] VGAM3442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48152] VGAM3442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3442 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48153] The complementary binding of VGAM3442 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3442 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48154] It is appreciated that VGAM3442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3442 host target genes. The mRNA of each one of this plurality of VGAM3442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3442 RNA, herein designated VGAM RNA, and which when bound by VGAM3442 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3442 host target proteins.

[48155] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3442 gene, herein designated VGAM GENE, on one or more VGAM3442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48156] It is yet further appreciated that a function of VGAM3442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3442 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM3442 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48157] Nucleotide sequences of the VGAM3442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3442 are further described hereinbelow with reference to Table 1.

[48158] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48159] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3443 (VGAM3443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48160] VGAM3443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3443 was detected is described hereinabove with reference to Figs. 2–8.

[48161] VGAM3443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48162] VGAM3443 gene, herein designated VGAM GENE, encodes a VGAM3443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3443 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3443 precursor RNA is designated SEQ ID:77308, and is provided hereinbelow with reference to the sequence listing part.

[48163] VGAM3443 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48164] An enzyme complex designated DICER COMPLEX, dices the VGAM3443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3443 RNA is designated SEQ ID:77309, and is provided hereinbelow with reference to the sequence listing part.

[48165] VGAM3443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48166] VGAM3443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3443 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48167] The complementary binding of VGAM3443 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3443 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48168] It is appreciated that VGAM3443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3443 host target genes. The mRNA of each one of this plurality of VGAM3443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3443 RNA, herein designated VGAM RNA, and which when bound by VGAM3443 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3443 host target proteins.

[48169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3443 gene, herein designated VGAM GENE, on one or more VGAM3443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48170] It is yet further appreciated that a function of VGAM3443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3443 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3443 correlate with, and may be deduced from, the identity of the host target genes which VGAM3443 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[48171] Nucleotide sequences of the VGAM3443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3443 are further described hereinbelow with reference to Table 1.

[48172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48173] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3444 (VGAM3444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48174] VGAM3444 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3444 was detected is described hereinabove with reference to Figs. 2–8.

[48175] VGAM3444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM3444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48176] VGAM3444 gene, herein designated VGAM GENE, encodes a VGAM3444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3444 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3444 precursor RNA is designated SEQ ID:77412, and is provided hereinbelow with reference to the sequence listing part.

[48177] VGAM3444 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48178] An enzyme complex designated DICER COMPLEX, dices the VGAM3444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3444 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3444 RNA is designated SEQ ID:77413, and is provided hereinbelow with reference to the sequence listing part.

[48179] VGAM3444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48180] VGAM3444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3444 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[48181] The complementary binding of VGAM3444 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3444 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48182] It is appreciated that VGAM3444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3444 host target genes. The mRNA of each one of this plurality of VGAM3444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3444 RNA, herein designated VGAM RNA, and which when bound by VGAM3444 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3444 host target proteins.

[48183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3444 gene, herein designated VGAM GENE, on one or more VGAM3444 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48184] It is yet further appreciated that a function of VGAM3444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3444 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3444 correlate with, and may be deduced from, the identity of the host target genes which VGAM3444 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[48185] Nucleotide sequences of the VGAM3444 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3444 are further described hereinbelow with reference to Table 1.

[48186] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48187] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3445 (VGAM3445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48188] VGAM3445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3445 was detected is described hereinabove with reference to Figs. 2–8.

[48189] VGAM3445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM3445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48190] VGAM3445 gene, herein designated VGAM GENE, encodes a VGAM3445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3445 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3445 precursor RNA is designated SEQ ID:77420, and is provided hereinbelow with reference to the sequence listing part.

[48191] VGAM3445 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48192] An enzyme complex designated DICER COMPLEX, dices the VGAM3445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3445 RNA is designated SEQ ID:77421, and is provided hereinbelow with reference to the sequence listing part.

[48193] VGAM3445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[48194] VGAM3445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3445 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48195] The complementary binding of VGAM3445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3445 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48196] It is appreciated that VGAM3445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3445 host target genes. The mRNA of each one of this plurality of VGAM3445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3445 RNA, herein designated VGAM RNA, and which when bound by VGAM3445 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3445 host target proteins.

[48197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3445 gene, herein designated VGAM GENE, on one

or more VGAM3445 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48198] It is yet further appreciated that a function of VGAM3445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3445 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3445 correlate with, and may be deduced from, the identity of the host target genes which VGAM3445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48199] Nucleotide sequences of the VGAM3445 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3445 are further described hereinbelow with reference to Table 1.

[48200] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48201] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3446 (VGAM3446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48202] VGAM3446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3446 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[48203] VGAM3446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM3446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48204] VGAM3446 gene, herein designated VGAM GENE, encodes a VGAM3446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3446 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3446 precursor RNA is designated SEQ ID:77426, and is provided hereinbelow with reference to the sequence listing part.

[48205] VGAM3446 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48206] An enzyme complex designated DICER COMPLEX, dices the VGAM3446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3446 RNA is designated SEQ ID:77427, and is provided hereinbelow with reference to the sequence listing part.

[48207] VGAM3446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48208] VGAM3446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3446 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48209] The complementary binding of VGAM3446 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3446 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48210] It is appreciated that VGAM3446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3446 host target genes. The mRNA of each one of this plurality of VGAM3446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3446 RNA, herein designated VGAM RNA, and which when bound by VGAM3446 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3446 host target proteins.

[48211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3446 gene, herein designated VGAM GENE, on one or more VGAM3446 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48212] It is yet further appreciated that a function of VGAM3446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3446 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3446 correlate with, and may be deduced from, the identity of the host target genes which VGAM3446 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48213] Nucleotide sequences of the VGAM3446 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3446 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3446 are further described hereinbelow with reference to Table 1.

[48214] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48215] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3447 (VGAM3447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48216] VGAM3447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3447 was detected is described hereinabove with reference to Figs. 2-8.

[48217] VGAM3447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM3447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48218] VGAM3447 gene, herein designated VGAM GENE, encodes a VGAM3447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3447 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3447 precursor RNA is designated SEQ ID:77444, and is provided hereinbelow with reference to the sequence listing part.

[48219] VGAM3447 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[48220] An enzyme complex designated DICER COMPLEX, dices the VGAM3447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3447 RNA is designated SEQ ID:77445, and is provided hereinbelow with reference to the sequence listing part.

[48221] VGAM3447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48222] VGAM3447 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3447 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48223] The complementary binding of VGAM3447 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3447 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48224] It is appreciated that VGAM3447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3447 host target genes. The mRNA of each one of this plurality of VGAM3447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3447 RNA, herein designated VGAM RNA, and which when bound by VGAM3447 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3447 host target proteins.

[48225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3447 gene, herein designated VGAM GENE, on one or more VGAM3447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48226] It is yet further appreciated that a function of VGAM3447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3447 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3447 correlate with, and may be deduced from, the identity of the host target genes which VGAM3447 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48227] Nucleotide sequences of the VGAM3447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3447 are further described hereinbelow with reference to Table 1.

[48228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48229] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3448 (VGAM3448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48230] VGAM3448 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3448 was detected is described hereinabove with reference to Figs. 2-8.

[48231] VGAM3448 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of *Ophiostoma novo-ulmi* mitovirus 5-Ld. VGAM3448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48232] VGAM3448 gene, herein designated VGAM GENE, encodes a VGAM3448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3448 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3448 precursor RNA is designated SEQ ID:77455, and is provided hereinbelow with reference to the sequence listing part.

[48233] VGAM3448 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48234] An enzyme complex designated DICER COMPLEX, dices the VGAM3448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3448 RNA is designated SEQ ID:77456, and is provided hereinbelow with reference to the sequence listing part.

[48235] VGAM3448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3448 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48236] VGAM3448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3448 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48237] The complementary binding of VGAM3448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3448 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3448 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48238] It is appreciated that VGAM3448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3448 host target genes. The mRNA of each one of this plurality of VGAM3448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3448 RNA, herein designated VGAM RNA, and which when bound by VGAM3448 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3448 host target proteins.

[48239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3448 gene, herein designated VGAM GENE, on one or more VGAM3448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48240] It is yet further appreciated that a function of VGAM3448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3448 include diagnosis, prevention and treatment of viral infection by *Ophiostoma novo-ulmi* mitovirus 5-Ld. Specific functions, and accordingly utilities, of VGAM3448 correlate with, and may be deduced from, the identity of the host target genes which VGAM3448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48241] Nucleotide sequences of the VGAM3448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3448 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3448 are further described hereinbelow with reference to Table 1.

[48242] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48243] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3449 (VGAM3449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48244] VGAM3449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3449 was detected is described hereinabove with reference to Figs. 2-8.

[48245] VGAM3449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human respiratory syn-

cytial virus. VGAM3449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48246] VGAM3449 gene, herein designated VGAM GENE, encodes a VGAM3449 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3449 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3449 precursor RNA is designated SEQ ID:77466, and is provided hereinbelow with reference to the sequence listing part.

[48247] VGAM3449 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48248] An enzyme complex designated DICER COMPLEX, dices

the VGAM3449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3449 RNA is designated SEQ ID:77467, and is provided hereinbelow with reference to the sequence listing part.

[48249] VGAM3449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3449 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48250] VGAM3449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3449 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3449 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48251] The complementary binding of VGAM3449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3449 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48252] It is appreciated that VGAM3449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3449 host target genes. The mRNA of each one of this plurality of VGAM3449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3449 RNA, herein designated VGAM RNA, and which when bound by VGAM3449 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3449 host target proteins.

[48253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3449 gene, herein designated VGAM GENE, on one or more VGAM3449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48254] It is yet further appreciated that a function of VGAM3449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3449 include diagnosis, prevention and treatment of viral infection by Human respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3449 correlate with, and may be deduced from, the identity of the host target genes which VGAM3449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48255] Nucleotide sequences of the VGAM3449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3449 are further described hereinbelow with reference to Table 1.

[48256] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48257] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3450 (VGAM3450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48258] VGAM3450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3450 was detected is described hereinabove with reference to Figs. 2-8.

[48259] VGAM3450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3450 host target gene, herein design-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48260] VGAM3450 gene, herein designated VGAM GENE, encodes a VGAM3450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3450 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3450 precursor RNA is designated SEQ ID:77489, and is provided hereinbelow with reference to the sequence listing part.

[48261] VGAM3450 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48262] An enzyme complex designated DICER COMPLEX, dices the VGAM3450 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3450 RNA is designated SEQ ID:77490, and is provided hereinbelow with reference to the sequence listing part.

[48263] VGAM3450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3450 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3450 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48264] VGAM3450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3450 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3450 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3450 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48265] The complementary binding of VGAM3450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3450

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48266] It is appreciated that VGAM3450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3450 host target genes. The mRNA of each one of this plurality of VGAM3450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3450 RNA, herein designated VGAM RNA, and which when bound by VGAM3450 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3450 host target proteins.

[48267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3450 gene, herein designated VGAM GENE, on one or more VGAM3450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48268] It is yet further appreciated that a function of VGAM3450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3450 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3450 correlate with, and may be deduced from, the identity of the host target genes which VGAM3450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48269] Nucleotide sequences of the VGAM3450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3450 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3450 are further described hereinbelow with reference to Table 1.

[48270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48271] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3451 (VGAM3451) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48272] VGAM3451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3451 was detected is described hereinabove with reference to Figs. 2-8.

[48273] VGAM3451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[48274] VGAM3451 gene, herein designated VGAM GENE, encodes a VGAM3451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3451 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3451 precursor RNA is designated SEQ ID:77493, and is provided hereinbelow with reference to the sequence listing part.

[48275] VGAM3451 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48276] An enzyme complex designated DICER COMPLEX, dices the VGAM3451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3451 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3451 RNA is designated SEQ ID:77494, and is provided hereinbelow with reference to the sequence listing part.

[48277] VGAM3451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3451 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48278] VGAM3451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3451 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3451 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48279] The complementary binding of VGAM3451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3451 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48280] It is appreciated that VGAM3451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3451 host target genes. The mRNA of each one of this plurality of VGAM3451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3451 RNA, herein designated VGAM RNA, and which when bound by VGAM3451 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3451 host target proteins.

[48281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3451 gene, herein designated VGAM GENE, on one or more VGAM3451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48282] It is yet further appreciated that a function of VGAM3451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3451 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3451 correlate with, and may be deduced from, the identity of the host target genes which VGAM3451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48283] Nucleotide sequences of the VGAM3451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3451 are further

described hereinbelow with reference to Table 1.

[48284] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48285] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3452 (VGAM3452) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48286] VGAM3452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3452 was detected is described hereinabove with reference to Figs. 2-8.

[48287] VGAM3452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48288] VGAM3452 gene, herein designated VGAM GENE, encodes a VGAM3452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3452 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3452 precursor RNA is designated SEQ ID:77517, and is provided hereinbelow with reference to the sequence listing part.

[48289] VGAM3452 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48290] An enzyme complex designated DICER COMPLEX, dices the VGAM3452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3452 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3452 RNA is designated SEQ ID:77518, and is provided hereinbelow with reference to the sequence listing part.

[48291] VGAM3452 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48292] VGAM3452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3452 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3452 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48293] The complementary binding of VGAM3452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3452 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3452 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48294] It is appreciated that VGAM3452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3452 host target genes. The mRNA of each one of this plurality of VGAM3452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3452 RNA, herein designated VGAM RNA, and which when bound by VGAM3452 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3452 host target proteins.

[48295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3452 gene, herein designated VGAM GENE, on one or more VGAM3452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48296] It is yet further appreciated that a function of VGAM3452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3452 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3452 correlate with, and may be deduced from, the identity of the host target genes which VGAM3452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48297] Nucleotide sequences of the VGAM3452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3452 are further described hereinbelow with reference to Table 1.

[48298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48299] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3453 (VGAM3453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48300] VGAM3453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3453 was detected is described hereinabove with reference to Figs. 2-8.

[48301] VGAM3453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM3453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48302] VGAM3453 gene, herein designated VGAM GENE, encodes

a VGAM3453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3453 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3453 precursor RNA is designated SEQ ID:77520, and is provided hereinbelow with reference to the sequence listing part.

[48303] VGAM3453 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48304] An enzyme complex designated DICER COMPLEX, dices the VGAM3453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3453 RNA is designated SEQ ID:77521, and is provided hereinbelow with reference to the sequence listing part.

[48305] VGAM3453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48306] VGAM3453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3453 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3453 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48307] The complementary binding of VGAM3453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3453 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[48308] It is appreciated that VGAM3453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3453 host target genes. The mRNA of each one of this plurality of VGAM3453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3453 RNA, herein designated VGAM RNA, and which when bound by VGAM3453 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3453 host target proteins.

[48309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3453 gene, herein designated VGAM GENE, on one or more VGAM3453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48310] It is yet further appreciated that a function of VGAM3453 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3453 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3453 correlate with, and may be deduced from, the identity of the host target genes which VGAM3453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48311] Nucleotide sequences of the VGAM3453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3453 are further described hereinbelow with reference to Table 1.

[48312] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48313] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3454 (VGAM3454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48314] VGAM3454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3454 was detected is described hereinabove with reference to Figs. 2-8.

[48315] VGAM3454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM3454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48316] VGAM3454 gene, herein designated VGAM GENE, encodes a VGAM3454 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3454 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3454 precursor RNA is designated SEQ ID:77534, and is provided hereinbelow with reference to the sequence listing part.

[48317] VGAM3454 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48318] An enzyme complex designated DICER COMPLEX, dices the VGAM3454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3454 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3454 RNA is designated SEQ ID:77535, and is provided hereinbelow with reference to the sequence listing part.

[48319] VGAM3454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48320] VGAM3454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3454 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48321] The complementary binding of VGAM3454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3454 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48322] It is appreciated that VGAM3454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3454 host target genes. The mRNA of each one of this plurality of VGAM3454 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3454 RNA, herein designated VGAM RNA, and which when bound by VGAM3454 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3454 host target proteins.

[48323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3454 gene, herein designated VGAM GENE, on one or more VGAM3454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48324] It is yet further appreciated that a function of VGAM3454 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3454 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM3454 correlate with, and may be deduced from, the identity of the host target genes which VGAM3454 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48325] Nucleotide sequences of the VGAM3454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3454 are further described hereinbelow with reference to Table 1.

[48326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48327] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3455 (VGAM3455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48328] VGAM3455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3455 was detected is described hereinabove with reference to Figs. 2-8.

[48329] VGAM3455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM3455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48330] VGAM3455 gene, herein designated VGAM GENE, encodes a VGAM3455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3455 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3455 precursor RNA is designated SEQ ID:77563, and is provided hereinbelow with reference to the sequence listing part.

[48331] VGAM3455 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48332] An enzyme complex designated DICER COMPLEX, dices the VGAM3455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3455 RNA is designated SEQ ID:77564, and is provided hereinbelow with reference to the sequence listing part.

[48333] VGAM3455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48334] VGAM3455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3455 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48335] The complementary binding of VGAM3455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3455 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48336] It is appreciated that VGAM3455 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3455 host target genes. The mRNA of each one of this plurality of VGAM3455 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3455 RNA, herein designated VGAM RNA, and which when bound by VGAM3455 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3455 host target proteins.

[48337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3455 gene, herein designated VGAM GENE, on one or more VGAM3455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48338] It is yet further appreciated that a function of VGAM3455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3455 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM3455 correlate with, and may be deduced from, the identity of the host target genes which VGAM3455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48339] Nucleotide sequences of the VGAM3455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3455 are further described hereinbelow with reference to Table 1.

[48340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48341] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3456 (VGAM3456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48342] VGAM3456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3456 was detected is described hereinabove with reference to Figs. 2–8.

[48343] VGAM3456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48344] VGAM3456 gene, herein designated VGAM GENE, encodes a VGAM3456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3456 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3456 precursor RNA is designated SEQ ID:77584, and is provided hereinbelow with reference to the sequence listing part.

[48345] VGAM3456 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48346] An enzyme complex designated DICER COMPLEX, dices the VGAM3456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3456 RNA is designated SEQ ID:77585, and is provided hereinbelow with reference to the sequence listing part.

[48347] VGAM3456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48348] VGAM3456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3456 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48349] The complementary binding of VGAM3456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3456 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48350] It is appreciated that VGAM3456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3456 host target genes. The mRNA of each one of this plurality of VGAM3456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3456 RNA, herein designated VGAM RNA, and which when bound by VGAM3456 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3456 host target proteins.

[48351] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3456 gene, herein designated VGAM GENE, on one or more VGAM3456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [48352] It is yet further appreciated that a function of VGAM3456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3456 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3456 correlate with, and may be deduced from, the identity of the host target genes which VGAM3456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [48353] Nucleotide sequences of the VGAM3456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3456 are further described hereinbelow with reference to Table 1.
- [48354] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48355] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3457 (VGAM3457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48356] VGAM3457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3457 was detected is described hereinabove with reference to Figs. 2–8.

[48357] VGAM3457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48358] VGAM3457 gene, herein designated VGAM GENE, encodes a VGAM3457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3457 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3457 precursor RNA is designated SEQ ID:77596, and is provided hereinbelow with reference to the sequence listing part.

[48359] VGAM3457 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48360] An enzyme complex designated DICER COMPLEX, dices the VGAM3457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3457 RNA is designated SEQ ID:77597, and is provided hereinbelow with reference to the sequence listing part.

[48361] VGAM3457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48362] VGAM3457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3457 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48363] The complementary binding of VGAM3457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3457 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48364] It is appreciated that VGAM3457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3457 host target genes. The mRNA of

each one of this plurality of VGAM3457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3457 RNA, herein designated VGAM RNA, and which when bound by VGAM3457 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3457 host target proteins.

[48365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3457 gene, herein designated VGAM GENE, on one or more VGAM3457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[48366] It is yet further appreciated that a function of VGAM3457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3457 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3457 correlate with, and may be deduced from, the identity of the host target genes which VGAM3457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48367] Nucleotide sequences of the VGAM3457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3457 are further described hereinbelow with reference to Table 1.

[48368] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3457 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[48369] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3458 (VGAM3458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48370] VGAM3458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3458 was detected is described hereinabove with reference to Figs. 2–8.

[48371] VGAM3458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48372] VGAM3458 gene, herein designated VGAM GENE, encodes a VGAM3458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3458 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3458 precursor RNA is designated SEQ ID:77647, and is provided hereinbelow with reference to the sequence listing part.

[48373] VGAM3458 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48374] An enzyme complex designated DICER COMPLEX, dices the VGAM3458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3458 RNA is designated SEQ ID:77648,

and is provided hereinbelow with reference to the sequence listing part.

[48375] VGAM3458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48376] VGAM3458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3458 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48377] The complementary binding of VGAM3458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3458 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3458 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48378] It is appreciated that VGAM3458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3458 host target genes. The mRNA of each one of this plurality of VGAM3458 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3458 RNA, herein designated VGAM RNA, and which when bound by VGAM3458 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3458 host target proteins.

[48379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3458 gene, herein designated VGAM GENE, on one or more VGAM3458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48380] It is yet further appreciated that a function of VGAM3458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3458 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3458 correlate with, and may be deduced from, the identity of the host target genes which VGAM3458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48381] Nucleotide sequences of the VGAM3458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3458 are further described hereinbelow with reference to Table 1.

[48382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48383] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3459 (VGAM3459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48384] VGAM3459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3459 was detected is described hereinabove with reference to Figs. 2–8.

[48385] VGAM3459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3459 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48386] VGAM3459 gene, herein designated VGAM GENE, encodes a VGAM3459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3459 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3459 precu-

sor RNA is designated SEQ ID:77661, and is provided hereinbelow with reference to the sequence listing part.

[48387] VGAM3459 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48388] An enzyme complex designated DICER COMPLEX, dices the VGAM3459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM3459 RNA is designated SEQ ID:77662, and is provided hereinbelow with reference to the se-

quence listing part.

[48389] VGAM3459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48390] VGAM3459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3459 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48391] The complementary binding of VGAM3459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3459 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48392] It is appreciated that VGAM3459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3459 host target genes. The mRNA of each one of this plurality of VGAM3459 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3459 RNA, herein designated VGAM RNA, and which when bound by VGAM3459 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3459 host target proteins.

[48393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3459 gene, herein designated VGAM GENE, on one or more VGAM3459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48394] It is yet further appreciated that a function of VGAM3459

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3459 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3459 correlate with, and may be deduced from, the identity of the host target genes which VGAM3459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48395] Nucleotide sequences of the VGAM3459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3459 are further described hereinbelow with reference to Table 1.

[48396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48397] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3460 (VGAM3460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48398] VGAM3460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3460 was detected is described hereinabove with reference to Figs. 2–8.

[48399] VGAM3460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM3460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48400] VGAM3460 gene, herein designated VGAM GENE, encodes a VGAM3460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3460 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3460 precursor RNA is designated SEQ ID:77756, and is provided

hereinbelow with reference to the sequence listing part.

[48401] VGAM3460 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48402] An enzyme complex designated DICER COMPLEX, dices the VGAM3460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3460 RNA is designated SEQ ID:77757, and is provided hereinbelow with reference to the sequence listing part.

[48403] VGAM3460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48404] VGAM3460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3460 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3460 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48405] The complementary binding of VGAM3460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3460 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48406] It is appreciated that VGAM3460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3460 host target genes. The mRNA of each one of this plurality of VGAM3460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3460 RNA, herein designated VGAM RNA, and which when bound by VGAM3460 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3460 host target proteins.

[48407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3460 gene, herein designated VGAM GENE, on one or more VGAM3460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48408] It is yet further appreciated that a function of VGAM3460 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3460 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3460 correlate with, and may be deduced from, the identity of the host target genes which VGAM3460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48409] Nucleotide sequences of the VGAM3460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3460 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3460 are further described hereinbelow with reference to Table 1.

[48410] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48411] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3461 (VGAM3461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48412] VGAM3461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3461 was detected is described hereinabove with reference to Figs. 2–8.

[48413] VGAM3461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48414] VGAM3461 gene, herein designated VGAM GENE, encodes a VGAM3461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3461 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3461 precursor RNA is designated SEQ ID:77799, and is provided hereinbelow with reference to the sequence listing part.

[48415] VGAM3461 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48416] An enzyme complex designated DICER COMPLEX, dices the VGAM3461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3461 RNA is designated SEQ ID:77800, and is provided hereinbelow with reference to the sequence listing part.

[48417] VGAM3461 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48418] VGAM3461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3461 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3461 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48419] The complementary binding of VGAM3461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3461 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48420] It is appreciated that VGAM3461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3461 host target genes. The mRNA of each one of this plurality of VGAM3461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3461 RNA, herein designated VGAM

RNA, and which when bound by VGAM3461 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3461 host target proteins.

[48421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3461 gene, herein designated VGAM GENE, on one or more VGAM3461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48422] It is yet further appreciated that a function of VGAM3461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3461 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM3461 correlate with, and may be deduced from, the identity of the host target genes which VGAM3461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48423] Nucleotide sequences of the VGAM3461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3461 are further described hereinbelow with reference to Table 1.

[48424] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48425] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3462 (VGAM3462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48426] VGAM3462 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3462 was detected is described hereinabove with reference to Figs. 2–8.

[48427] VGAM3462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48428] VGAM3462 gene, herein designated VGAM GENE, encodes a VGAM3462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3462 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3462 precursor RNA is designated SEQ ID:77818, and is provided hereinbelow with reference to the sequence listing part.

[48429] VGAM3462 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48430] An enzyme complex designated DICER COMPLEX, dices the VGAM3462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3462 RNA is designated SEQ ID:77819, and is provided hereinbelow with reference to the sequence listing part.

[48431] VGAM3462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3462 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48432] VGAM3462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3462 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3462 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48433] The complementary binding of VGAM3462 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3462 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48434] It is appreciated that VGAM3462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3462 host target genes. The mRNA of each one of this plurality of VGAM3462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3462 RNA, herein designated VGAM RNA, and which when bound by VGAM3462 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3462 host target proteins.

[48435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3462 gene, herein designated VGAM GENE, on one or more VGAM3462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48436] It is yet further appreciated that a function of VGAM3462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3462 include diagnosis, prevention and

treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM3462 correlate with, and may be deduced from, the identity of the host target genes which VGAM3462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48437] Nucleotide sequences of the VGAM3462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3462 are further described hereinbelow with reference to Table 1.

[48438] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48439] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3463 (VGAM3463) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48440] VGAM3463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3463 was detected is described hereinabove with reference to Figs. 2–8.

[48441] VGAM3463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM3463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48442] VGAM3463 gene, herein designated VGAM GENE, encodes a VGAM3463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3463 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3463 precursor RNA is designated SEQ ID:77936, and is provided hereinbelow with reference to the sequence listing part.

[48443] VGAM3463 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3463 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48444] An enzyme complex designated DICER COMPLEX, dices the VGAM3463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3463 RNA is designated SEQ ID:77937, and is provided hereinbelow with reference to the sequence listing part.

[48445] VGAM3463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3463 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3463 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48446] VGAM3463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3463 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3463 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48447] The complementary binding of VGAM3463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3463 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48448] It is appreciated that VGAM3463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3463 host target genes. The mRNA of each one of this plurality of VGAM3463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3463 RNA, herein designated VGAM RNA, and which when bound by VGAM3463 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3463 host target proteins.

[48449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3463 gene, herein designated VGAM GENE, on one or more VGAM3463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48450] It is yet further appreciated that a function of VGAM3463 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3463 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Spe-

cific functions, and accordingly utilities, of VGAM3463 correlate with, and may be deduced from, the identity of the host target genes which VGAM3463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48451] Nucleotide sequences of the VGAM3463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3463 are further described hereinbelow with reference to Table 1.

[48452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48453] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3464 (VGAM3464) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[48454] VGAM3464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3464 was detected is described hereinabove with reference to Figs. 2–8.

[48455] VGAM3464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM3464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48456] VGAM3464 gene, herein designated VGAM GENE, encodes a VGAM3464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3464 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3464 precursor RNA is designated SEQ ID:78090, and is provided hereinbelow with reference to the sequence listing part.

[48457] VGAM3464 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3464 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48458] An enzyme complex designated DICER COMPLEX, dices the VGAM3464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3464 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3464 RNA is designated SEQ ID:78091, and is provided hereinbelow with reference to the sequence listing part.

[48459] VGAM3464 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3464 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48460] VGAM3464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3464 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48461] The complementary binding of VGAM3464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3464 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48462] It is appreciated that VGAM3464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3464 host target genes. The mRNA of each one of this plurality of VGAM3464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3464 RNA, herein designated VGAM RNA, and which when bound by VGAM3464 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3464 host target proteins.

[48463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3464 gene, herein designated VGAM GENE, on one or more VGAM3464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48464] It is yet further appreciated that a function of VGAM3464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3464 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM3464 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM3464 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48465] Nucleotide sequences of the VGAM3464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3464 are further described hereinbelow with reference to Table 1.

[48466] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48467] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3465 (VGAM3465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[48468] VGAM3465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3465 was detected is described hereinabove with reference to Figs. 2–8.

[48469] VGAM3465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48470] VGAM3465 gene, herein designated VGAM GENE, encodes a VGAM3465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3465 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3465 precursor RNA is designated SEQ ID:78119, and is provided hereinbelow with reference to the sequence listing part.

[48471] VGAM3465 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48472] An enzyme complex designated DICER COMPLEX, dices the VGAM3465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3465 RNA is designated SEQ ID:78120, and is provided hereinbelow with reference to the sequence listing part.

[48473] VGAM3465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48474] VGAM3465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3465 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48475] The complementary binding of VGAM3465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3465 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48476] It is appreciated that VGAM3465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3465 host target genes. The mRNA of each one of this plurality of VGAM3465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3465 RNA, herein designated VGAM RNA, and which when bound by VGAM3465 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3465 host target proteins.

[48477] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3465 gene, herein designated VGAM GENE, on one or more VGAM3465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48478] It is yet further appreciated that a function of VGAM3465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3465 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3465 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48479] Nucleotide sequences of the VGAM3465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3465 are further described hereinbelow with reference to Table 1.

[48480] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48481] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3466 (VGAM3466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48482] VGAM3466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3466 was detected is described hereinabove with reference to Figs. 2–8.

[48483] VGAM3466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 49. VGAM3466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48484] VGAM3466 gene, herein designated VGAM GENE, encodes a VGAM3466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3466 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3466 precursor RNA is designated SEQ ID:78125, and is provided hereinbelow with reference to the sequence listing part.

[48485] VGAM3466 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48486] An enzyme complex designated DICER COMPLEX, dices the VGAM3466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3466 RNA is designated SEQ ID:78126, and is provided hereinbelow with reference to the sequence listing part.

[48487] VGAM3466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48488] VGAM3466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3466 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48489] The complementary binding of VGAM3466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3466 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48490] It is appreciated that VGAM3466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3466 host target genes. The mRNA of each one of this plurality of VGAM3466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3466 RNA, herein designated VGAM RNA, and which when bound by VGAM3466 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3466 host target proteins.

[48491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3466 gene, herein designated VGAM GENE, on one or more VGAM3466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48492] It is yet further appreciated that a function of VGAM3466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3466 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 49. Specific functions, and accordingly utilities, of VGAM3466 correlate with, and may be deduced from, the identity of the host target genes which VGAM3466 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48493] Nucleotide sequences of the VGAM3466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3466 are further described hereinbelow with reference to Table 1.

[48494] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3466 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48495] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3467 (VGAM3467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48496] VGAM3467 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3467 was detected is described hereinabove with reference to Figs. 2–8.

[48497] VGAM3467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 49. VGAM3467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48498] VGAM3467 gene, herein designated VGAM GENE, encodes a VGAM3467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3467 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3467 precursor RNA is designated SEQ ID:78130, and is provided hereinbelow with reference to the sequence listing part.

[48499] VGAM3467 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48500] An enzyme complex designated DICER COMPLEX, dices the VGAM3467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3467 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3467 RNA is designated SEQ ID:78131, and is provided hereinbelow with reference to the sequence listing part.

[48501] VGAM3467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48502] VGAM3467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3467 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3'UTR and 5'UTR regions.

[48503] The complementary binding of VGAM3467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3467 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48504] It is appreciated that VGAM3467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3467 host target genes. The mRNA of each one of this plurality of VGAM3467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3467 RNA, herein designated VGAM RNA, and which when bound by VGAM3467 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3467 host target proteins.

[48505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3467 gene, herein designated VGAM GENE, on one or more VGAM3467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48506] It is yet further appreciated that a function of VGAM3467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3467 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 49. Specific functions, and accordingly utilities, of VGAM3467 correlate with, and may be deduced from, the identity of the host target genes which VGAM3467 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[48507] Nucleotide sequences of the VGAM3467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3467 are further described hereinbelow with reference to Table 1.

[48508] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48509] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3468 (VGAM3468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48510] VGAM3468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3468 was detected is described hereinabove with reference to Figs. 2–8.

[48511] VGAM3468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory syncytial virus. VGAM3468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48512] VGAM3468 gene, herein designated VGAM GENE, encodes a VGAM3468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3468 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3468 precursor RNA is designated SEQ ID:78149, and is provided hereinbelow with reference to the sequence listing part.

[48513] VGAM3468 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48514] An enzyme complex designated DICER COMPLEX, dices the VGAM3468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3468 RNA is designated SEQ ID:78150, and is provided hereinbelow with reference to the sequence listing part.

[48515] VGAM3468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[48516] VGAM3468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3468 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48517] The complementary binding of VGAM3468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3468 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48518] It is appreciated that VGAM3468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3468 host target genes. The mRNA of each one of this plurality of VGAM3468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3468 RNA, herein designated VGAM RNA, and which when bound by VGAM3468 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3468 host target proteins.

[48519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3468 gene, herein designated VGAM GENE, on one

or more VGAM3468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48520] It is yet further appreciated that a function of VGAM3468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3468 include diagnosis, prevention and treatment of viral infection by Respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3468 correlate with, and may be deduced from, the identity of the host target genes which VGAM3468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48521] Nucleotide sequences of the VGAM3468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3468 are further described hereinbelow with reference to Table 1.

[48522] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48523] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3469 (VGAM3469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48524] VGAM3469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3469 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[48525] VGAM3469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus.

VGAM3469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48526] VGAM3469 gene, herein designated VGAM GENE, encodes a VGAM3469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3469 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3469 precursor RNA is designated SEQ ID:78152, and is provided hereinbelow with reference to the sequence listing part.

[48527] VGAM3469 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48528] An enzyme complex designated DICER COMPLEX, dices the VGAM3469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3469 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3469 RNA is designated SEQ ID:78153, and is provided hereinbelow with reference to the sequence listing part.

[48529] VGAM3469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48530] VGAM3469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3469 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48531] The complementary binding of VGAM3469 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3469 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48532] It is appreciated that VGAM3469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3469 host target genes. The mRNA of each one of this plurality of VGAM3469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3469 RNA, herein designated VGAM RNA, and which when bound by VGAM3469 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3469 host target proteins.

[48533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3469 gene, herein designated VGAM GENE, on one or more VGAM3469 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48534] It is yet further appreciated that a function of VGAM3469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3469 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM3469 correlate with, and may be deduced from, the identity of the host target genes which VGAM3469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48535] Nucleotide sequences of the VGAM3469 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3469 are further described hereinbelow with reference to Table 1.

[48536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48537] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3470 (VGAM3470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48538] VGAM3470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3470 was detected is described hereinabove with reference to Figs. 2-8.

[48539] VGAM3470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine polyomavirus. VGAM3470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48540] VGAM3470 gene, herein designated VGAM GENE, encodes a VGAM3470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3470 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3470 precursor RNA is designated SEQ ID:78182, and is provided hereinbelow with reference to the sequence listing part.

[48541] VGAM3470 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[48542] An enzyme complex designated DICER COMPLEX, dices the VGAM3470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3470 RNA is designated SEQ ID:78183, and is provided hereinbelow with reference to the sequence listing part.

[48543] VGAM3470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48544] VGAM3470 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3470 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48545] The complementary binding of VGAM3470 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3470 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48546] It is appreciated that VGAM3470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3470 host target genes. The mRNA of each one of this plurality of VGAM3470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3470 RNA, herein designated VGAM RNA, and which when bound by VGAM3470 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3470 host target proteins.

[48547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3470 gene, herein designated VGAM GENE, on one or more VGAM3470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48548] It is yet further appreciated that a function of VGAM3470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3470 include diagnosis, prevention and treatment of viral infection by Bovine polyomavirus. Specific functions, and accordingly utilities, of VGAM3470 correlate with, and may be deduced from, the identity of the host target genes which VGAM3470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48549] Nucleotide sequences of the VGAM3470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3470 are further described hereinbelow with reference to Table 1.

[48550] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48551] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3471 (VGAM3471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48552] VGAM3471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3471 was detected is described hereinabove with reference to Figs. 2-8.

[48553] VGAM3471 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 1. VGAM3471 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48554] VGAM3471 gene, herein designated VGAM GENE, encodes a VGAM3471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3471 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3471 precursor RNA is designated SEQ ID:78229, and is provided hereinbelow with reference to the sequence listing part.

[48555] VGAM3471 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48556] An enzyme complex designated DICER COMPLEX, dices the VGAM3471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3471 RNA is designated SEQ ID:78230, and is provided hereinbelow with reference to the sequence listing part.

[48557] VGAM3471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3471 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48558] VGAM3471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3471 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3471 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48559] The complementary binding of VGAM3471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3471 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3471 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48560] It is appreciated that VGAM3471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3471 host target genes. The mRNA of each one of this plurality of VGAM3471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3471 RNA, herein designated VGAM RNA, and which when bound by VGAM3471 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3471 host target proteins.

[48561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3471 gene, herein designated VGAM GENE, on one or more VGAM3471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48562] It is yet further appreciated that a function of VGAM3471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3471 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3471 correlate with, and may be deduced from, the identity of the host target genes which VGAM3471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48563] Nucleotide sequences of the VGAM3471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3471 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3471 are further described hereinbelow with reference to Table 1.

[48564] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48565] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3472 (VGAM3472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48566] VGAM3472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3472 was detected is described hereinabove with reference to Figs. 2-8.

[48567] VGAM3472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2.

VGAM3472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48568] VGAM3472 gene, herein designated VGAM GENE, encodes a VGAM3472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3472 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3472 precursor RNA is designated SEQ ID:78875, and is provided hereinbelow with reference to the sequence listing part.

[48569] VGAM3472 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48570] An enzyme complex designated DICER COMPLEX, dices

the VGAM3472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3472 RNA is designated SEQ ID:78876, and is provided hereinbelow with reference to the sequence listing part.

[48571] VGAM3472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3472 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48572] VGAM3472 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3472 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3472 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48573] The complementary binding of VGAM3472 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3472 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48574] It is appreciated that VGAM3472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3472 host target genes. The mRNA of each one of this plurality of VGAM3472 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3472 RNA, herein designated VGAM RNA, and which when bound by VGAM3472 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3472 host target proteins.

[48575] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3472 gene, herein designated VGAM GENE, on one or more VGAM3472 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48576] It is yet further appreciated that a function of VGAM3472 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3472 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3472 correlate with, and may be deduced from, the identity of the host target genes which VGAM3472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48577] Nucleotide sequences of the VGAM3472 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3472 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3472 are further described hereinbelow with reference to Table 1.

[48578] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48579] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3473 (VGAM3473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48580] VGAM3473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3473 was detected is described hereinabove with reference to Figs. 2-8.

[48581] VGAM3473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3473 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[48582] VGAM3473 gene, herein designated VGAM GENE, encodes a VGAM3473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3473 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3473 precursor RNA is designated SEQ ID:78883, and is provided hereinbelow with reference to the sequence listing part.

[48583] VGAM3473 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48584] An enzyme complex designated DICER COMPLEX, dices the VGAM3473 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3473 RNA is designated SEQ ID:78884, and is provided hereinbelow with reference to the sequence listing part.

[48585] VGAM3473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3473 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48586] VGAM3473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3473 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3473 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48587] The complementary binding of VGAM3473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3473

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48588] It is appreciated that VGAM3473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3473 host target genes. The mRNA of each one of this plurality of VGAM3473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3473 RNA, herein designated VGAM RNA, and which when bound by VGAM3473 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3473 host target proteins.

[48589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3473 gene, herein designated VGAM GENE, on one or more VGAM3473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48590] It is yet further appreciated that a function of VGAM3473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3473 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3473 correlate with, and may be deduced from, the identity of the host target genes which VGAM3473 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48591] Nucleotide sequences of the VGAM3473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3473 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3473 are further described hereinbelow with reference to Table 1.

[48592] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48593] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3474 (VGAM3474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48594] VGAM3474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3474 was detected is described hereinabove with reference to Figs. 2-8.

[48595] VGAM3474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[48596] VGAM3474 gene, herein designated VGAM GENE, encodes a VGAM3474 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3474 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3474 precursor RNA is designated SEQ ID:78915, and is provided hereinbelow with reference to the sequence listing part.

[48597] VGAM3474 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48598] An enzyme complex designated DICER COMPLEX, dices the VGAM3474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3474 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3474 RNA is designated SEQ ID:78916, and is provided hereinbelow with reference to the sequence listing part.

[48599] VGAM3474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3474 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48600] VGAM3474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3474 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48601] The complementary binding of VGAM3474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3474 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48602] It is appreciated that VGAM3474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3474 host target genes. The mRNA of each one of this plurality of VGAM3474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3474 RNA, herein designated VGAM RNA, and which when bound by VGAM3474 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3474 host target proteins.

[48603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3474 gene, herein designated VGAM GENE, on one or more VGAM3474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48604] It is yet further appreciated that a function of VGAM3474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3474 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3474 correlate with, and may be deduced from, the identity of the host target genes which VGAM3474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48605] Nucleotide sequences of the VGAM3474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3474 are further

described hereinbelow with reference to Table 1.

[48606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48607] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3475 (VGAM3475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48608] VGAM3475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3475 was detected is described hereinabove with reference to Figs. 2-8.

[48609] VGAM3475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM3475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48610] VGAM3475 gene, herein designated VGAM GENE, encodes a VGAM3475 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3475 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3475 precursor RNA is designated SEQ ID:78920, and is provided hereinbelow with reference to the sequence listing part.

[48611] VGAM3475 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48612] An enzyme complex designated DICER COMPLEX, dices the VGAM3475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3475 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3475 RNA is designated SEQ ID:78921, and is provided hereinbelow with reference to the sequence listing part.

[48613] VGAM3475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48614] VGAM3475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3475 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48615] The complementary binding of VGAM3475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3475 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3475 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48616] It is appreciated that VGAM3475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3475 host target genes. The mRNA of each one of this plurality of VGAM3475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3475 RNA, herein designated VGAM RNA, and which when bound by VGAM3475 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3475 host target proteins.

[48617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3475 gene, herein designated VGAM GENE, on one or more VGAM3475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48618] It is yet further appreciated that a function of VGAM3475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3475 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3475 correlate with, and may be deduced from, the identity of the host target genes which VGAM3475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48619] Nucleotide sequences of the VGAM3475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3475 are further described hereinbelow with reference to Table 1.

[48620] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48621] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3476 (VGAM3476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48622] VGAM3476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3476 was detected is described hereinabove with reference to Figs. 2-8.

[48623] VGAM3476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine epidemic diarrhea virus. VGAM3476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48624] VGAM3476 gene, herein designated VGAM GENE, encodes

a VGAM3476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3476 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3476 precursor RNA is designated SEQ ID:78934, and is provided hereinbelow with reference to the sequence listing part.

[48625] VGAM3476 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48626] An enzyme complex designated DICER COMPLEX, dices the VGAM3476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3476 RNA is designated SEQ ID:78935, and is provided hereinbelow with reference to the sequence listing part.

[48627] VGAM3476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48628] VGAM3476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3476 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48629] The complementary binding of VGAM3476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3476 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[48630] It is appreciated that VGAM3476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3476 host target genes. The mRNA of each one of this plurality of VGAM3476 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3476 RNA, herein designated VGAM RNA, and which when bound by VGAM3476 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3476 host target proteins.

[48631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3476 gene, herein designated VGAM GENE, on one or more VGAM3476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48632] It is yet further appreciated that a function of VGAM3476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3476 include diagnosis, prevention and treatment of viral infection by Porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM3476 correlate with, and may be deduced from, the identity of the host target genes which VGAM3476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48633] Nucleotide sequences of the VGAM3476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3476 are further described hereinbelow with reference to Table 1.

[48634] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48635] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3477 (VGAM3477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48636] VGAM3477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3477 was detected is described hereinabove with reference to Figs. 2-8.

[48637] VGAM3477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus. VGAM3477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48638] VGAM3477 gene, herein designated VGAM GENE, encodes a VGAM3477 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3477 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3477 precursor RNA is designated SEQ ID:78940, and is provided hereinbelow with reference to the sequence listing part.

[48639] VGAM3477 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48640] An enzyme complex designated DICER COMPLEX, dices the VGAM3477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3477 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3477 RNA is designated SEQ ID:78941, and is provided hereinbelow with reference to the sequence listing part.

[48641] VGAM3477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48642] VGAM3477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3477 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48643] The complementary binding of VGAM3477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3477 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48644] It is appreciated that VGAM3477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3477 host target genes. The mRNA of each one of this plurality of VGAM3477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3477 RNA, herein designated VGAM RNA, and which when bound by VGAM3477 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3477 host target proteins.

[48645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3477 gene, herein designated VGAM GENE, on one or more VGAM3477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48646] It is yet further appreciated that a function of VGAM3477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3477 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM3477 correlate with, and may be deduced from, the identity of the host target genes which VGAM3477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48647] Nucleotide sequences of the VGAM3477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3477 are further described hereinbelow with reference to Table 1.

[48648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48649] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3478 (VGAM3478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48650] VGAM3478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3478 was detected is described hereinabove with reference to Figs. 2-8.

[48651] VGAM3478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus.

VGAM3478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48652] VGAM3478 gene, herein designated VGAM GENE, encodes a VGAM3478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3478 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3478 precursor RNA is designated SEQ ID:78958, and is provided hereinbelow with reference to the sequence listing part.

[48653] VGAM3478 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48654] An enzyme complex designated DICER COMPLEX, dices the VGAM3478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3478 RNA is designated SEQ ID:78959, and is provided hereinbelow with reference to the sequence listing part.

[48655] VGAM3478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48656] VGAM3478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3478 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48657] The complementary binding of VGAM3478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3478 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48658] It is appreciated that VGAM3478 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3478 host target genes. The mRNA of each one of this plurality of VGAM3478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3478 RNA, herein designated VGAM RNA, and which when bound by VGAM3478 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3478 host target proteins.

[48659] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3478 gene, herein designated VGAM GENE, on one or more VGAM3478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48660] It is yet further appreciated that a function of VGAM3478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3478 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM3478 correlate with, and may be deduced from, the identity of the host target genes which VGAM3478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48661] Nucleotide sequences of the VGAM3478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3478 are further described hereinbelow with reference to Table 1.

[48662] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48663] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3479 (VGAM3479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48664] VGAM3479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3479 was detected is described hereinabove with reference to Figs. 2–8.

[48665] VGAM3479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM3479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48666] VGAM3479 gene, herein designated VGAM GENE, encodes a VGAM3479 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3479 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3479 precursor RNA is designated SEQ ID:78963, and is provided hereinbelow with reference to the sequence listing part.

[48667] VGAM3479 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48668] An enzyme complex designated DICER COMPLEX, dices the VGAM3479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3479 RNA is designated SEQ ID:78964, and is provided hereinbelow with reference to the sequence listing part.

[48669] VGAM3479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48670] VGAM3479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3479 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48671] The complementary binding of VGAM3479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3479 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48672] It is appreciated that VGAM3479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3479 host target genes. The mRNA of each one of this plurality of VGAM3479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3479 RNA, herein designated VGAM RNA, and which when bound by VGAM3479 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3479 host target proteins.

[48673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3479 gene, herein designated VGAM GENE, on one or more VGAM3479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [48674] It is yet further appreciated that a function of VGAM3479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3479 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM3479 correlate with, and may be deduced from, the identity of the host target genes which VGAM3479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [48675] Nucleotide sequences of the VGAM3479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3479 are further described hereinbelow with reference to Table 1.
- [48676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48677] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3480 (VGAM3480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48678] VGAM3480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3480 was detected is described hereinabove with reference to Figs. 2-8.

[48679] VGAM3480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM3480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48680] VGAM3480 gene, herein designated VGAM GENE, encodes a VGAM3480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3480 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3480 precursor RNA is designated SEQ ID:78968, and is provided hereinbelow with reference to the sequence listing part.

[48681] VGAM3480 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48682] An enzyme complex designated DICER COMPLEX, dices the VGAM3480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3480 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3480 RNA is designated SEQ ID:78969, and is provided hereinbelow with reference to the sequence listing part.

[48683] VGAM3480 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48684] VGAM3480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3480 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48685] The complementary binding of VGAM3480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3480 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48686] It is appreciated that VGAM3480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3480 host target genes. The mRNA of

each one of this plurality of VGAM3480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3480 RNA, herein designated VGAM RNA, and which when bound by VGAM3480 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3480 host target proteins.

[48687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3480 gene, herein designated VGAM GENE, on one or more VGAM3480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[48688] It is yet further appreciated that a function of VGAM3480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3480 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM3480 correlate with, and may be deduced from, the identity of the host target genes which VGAM3480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48689] Nucleotide sequences of the VGAM3480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3480 are further described hereinbelow with reference to Table 1.

[48690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3480 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[48691] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3481 (VGAM3481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48692] VGAM3481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3481 was detected is described hereinabove with reference to Figs. 2–8.

[48693] VGAM3481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48694] VGAM3481 gene, herein designated VGAM GENE, encodes a VGAM3481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3481 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3481 precursor RNA is designated SEQ ID:78986, and is provided hereinbelow with reference to the sequence listing part.

[48695] VGAM3481 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48696] An enzyme complex designated DICER COMPLEX, dices the VGAM3481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3481 RNA is designated SEQ ID:78987,

and is provided hereinbelow with reference to the sequence listing part.

[48697] VGAM3481 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48698] VGAM3481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3481 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48699] The complementary binding of VGAM3481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3481 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48700] It is appreciated that VGAM3481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3481 host target genes. The mRNA of each one of this plurality of VGAM3481 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3481 RNA, herein designated VGAM RNA, and which when bound by VGAM3481 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3481 host target proteins.

[48701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3481 gene, herein designated VGAM GENE, on one or more VGAM3481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48702] It is yet further appreciated that a function of VGAM3481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3481 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3481 correlate with, and may be deduced from, the identity of the host target genes which VGAM3481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48703] Nucleotide sequences of the VGAM3481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3481 are further described hereinbelow with reference to Table 1.

[48704] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48705] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3482 (VGAM3482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48706] VGAM3482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3482 was detected is described hereinabove with reference to Figs. 2–8.

[48707] VGAM3482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48708] VGAM3482 gene, herein designated VGAM GENE, encodes a VGAM3482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3482 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3482 precu-

sor RNA is designated SEQ ID:79050, and is provided hereinbelow with reference to the sequence listing part.

[48709] VGAM3482 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48710] An enzyme complex designated DICER COMPLEX, dices the VGAM3482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3482 RNA is designated SEQ ID:79051, and is provided hereinbelow with reference to the se-

quence listing part.

[48711] VGAM3482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48712] VGAM3482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3482 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48713] The complementary binding of VGAM3482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3482 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48714] It is appreciated that VGAM3482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3482 host target genes. The mRNA of each one of this plurality of VGAM3482 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3482 RNA, herein designated VGAM RNA, and which when bound by VGAM3482 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3482 host target proteins.

[48715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3482 gene, herein designated VGAM GENE, on one or more VGAM3482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48716] It is yet further appreciated that a function of VGAM3482

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3482 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3482 correlate with, and may be deduced from, the identity of the host target genes which VGAM3482 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48717] Nucleotide sequences of the VGAM3482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3482 are further described hereinbelow with reference to Table 1.

[48718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48719] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3483 (VGAM3483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48720] VGAM3483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3483 was detected is described hereinabove with reference to Figs. 2–8.

[48721] VGAM3483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM3483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48722] VGAM3483 gene, herein designated VGAM GENE, encodes a VGAM3483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3483 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3483 precursor RNA is designated SEQ ID:79065, and is provided

hereinbelow with reference to the sequence listing part.

[48723] VGAM3483 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48724] An enzyme complex designated DICER COMPLEX, dices the VGAM3483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3483 RNA is designated SEQ ID:79066, and is provided hereinbelow with reference to the sequence listing part.

[48725] VGAM3483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48726] VGAM3483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3483 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3483 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48727] The complementary binding of VGAM3483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3483 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48728] It is appreciated that VGAM3483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3483 host target genes. The mRNA of each one of this plurality of VGAM3483 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3483 RNA, herein designated VGAM RNA, and which when bound by VGAM3483 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3483 host target proteins.

[48729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3483 gene, herein designated VGAM GENE, on one or more VGAM3483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48730] It is yet further appreciated that a function of VGAM3483 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3483 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3483 correlate with, and may be deduced from, the identity of the host target genes which VGAM3483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48731] Nucleotide sequences of the VGAM3483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3483 are further described hereinbelow with reference to Table 1.

[48732] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48733] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3484 (VGAM3484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48734] VGAM3484 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3484 was detected is described hereinabove with reference to Figs. 2–8.

[48735] VGAM3484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48736] VGAM3484 gene, herein designated VGAM GENE, encodes a VGAM3484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3484 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3484 precursor RNA is designated SEQ ID:79073, and is provided hereinbelow with reference to the sequence listing part.

[48737] VGAM3484 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48738] An enzyme complex designated DICER COMPLEX, dices the VGAM3484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3484 RNA is designated SEQ ID:79074, and is provided hereinbelow with reference to the sequence listing part.

[48739] VGAM3484 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48740] VGAM3484 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3484 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3484 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48741] The complementary binding of VGAM3484 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3484 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48742] It is appreciated that VGAM3484 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3484 host target genes. The mRNA of each one of this plurality of VGAM3484 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3484 RNA, herein designated VGAM

RNA, and which when bound by VGAM3484 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3484 host target proteins.

[48743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3484 gene, herein designated VGAM GENE, on one or more VGAM3484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48744] It is yet further appreciated that a function of VGAM3484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3484 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3484 correlate with, and may be deduced from, the identity of the host target genes which VGAM3484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48745] Nucleotide sequences of the VGAM3484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3484 are further described hereinbelow with reference to Table 1.

[48746] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48747] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3485 (VGAM3485) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48748] VGAM3485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3485 was detected is described hereinabove with reference to Figs. 2-8.

[48749] VGAM3485 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48750] VGAM3485 gene, herein designated VGAM GENE, encodes a VGAM3485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3485 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3485 precursor RNA is designated SEQ ID:79087, and is provided hereinbelow with reference to the sequence listing part.

[48751] VGAM3485 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48752] An enzyme complex designated DICER COMPLEX, dices the VGAM3485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3485 RNA is designated SEQ ID:79088, and is provided hereinbelow with reference to the sequence listing part.

[48753] VGAM3485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3485 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48754] VGAM3485 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3485 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3485 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3485 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48755] The complementary binding of VGAM3485 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3485 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48756] It is appreciated that VGAM3485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3485 host target genes. The mRNA of each one of this plurality of VGAM3485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3485 RNA, herein designated VGAM RNA, and which when bound by VGAM3485 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3485 host target proteins.

[48757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3485 gene, herein designated VGAM GENE, on one or more VGAM3485 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48758] It is yet further appreciated that a function of VGAM3485 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3485 include diagnosis, prevention and

treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3485 correlate with, and may be deduced from, the identity of the host target genes which VGAM3485 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48759] Nucleotide sequences of the VGAM3485 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3485 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3485 are further described hereinbelow with reference to Table 1.

[48760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3485 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48761] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3486 (VGAM3486) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48762] VGAM3486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3486 was detected is described hereinabove with reference to Figs. 2–8.

[48763] VGAM3486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus A. VGAM3486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48764] VGAM3486 gene, herein designated VGAM GENE, encodes a VGAM3486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3486 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3486 precursor RNA is designated SEQ ID:79105, and is provided hereinbelow with reference to the sequence listing part.

[48765] VGAM3486 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3486 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48766] An enzyme complex designated DICER COMPLEX, dices the VGAM3486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3486 RNA is designated SEQ ID:79106, and is provided hereinbelow with reference to the sequence listing part.

[48767] VGAM3486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3486 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3486 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48768] VGAM3486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3486 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3486 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48769] The complementary binding of VGAM3486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3486 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48770] It is appreciated that VGAM3486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3486 host target genes. The mRNA of each one of this plurality of VGAM3486 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3486 RNA, herein designated VGAM RNA, and which when bound by VGAM3486 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3486 host target proteins.

[48771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3486 gene, herein designated VGAM GENE, on one or more VGAM3486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48772] It is yet further appreciated that a function of VGAM3486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3486 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus A. Spe-

cific functions, and accordingly utilities, of VGAM3486 correlate with, and may be deduced from, the identity of the host target genes which VGAM3486 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48773] Nucleotide sequences of the VGAM3486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3486 are further described hereinbelow with reference to Table 1.

[48774] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48775] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3487 (VGAM3487) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[48776] VGAM3487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3487 was detected is described hereinabove with reference to Figs. 2–8.

[48777] VGAM3487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48778] VGAM3487 gene, herein designated VGAM GENE, encodes a VGAM3487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3487 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3487 precursor RNA is designated SEQ ID:79124, and is provided hereinbelow with reference to the sequence listing part.

[48779] VGAM3487 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3487 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48780] An enzyme complex designated DICER COMPLEX, dices the VGAM3487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3487 RNA is designated SEQ ID:79125, and is provided hereinbelow with reference to the sequence listing part.

[48781] VGAM3487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3487 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48782] VGAM3487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3487 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48783] The complementary binding of VGAM3487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3487 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48784] It is appreciated that VGAM3487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3487 host target genes. The mRNA of each one of this plurality of VGAM3487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3487 RNA, herein designated VGAM RNA, and which when bound by VGAM3487 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3487 host target proteins.

[48785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3487 gene, herein designated VGAM GENE, on one or more VGAM3487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48786] It is yet further appreciated that a function of VGAM3487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3487 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities,

of VGAM3487 correlate with, and may be deduced from, the identity of the host target genes which VGAM3487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48787] Nucleotide sequences of the VGAM3487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3487 are further described hereinbelow with reference to Table 1.

[48788] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48789] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3488 (VGAM3488) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[48790] VGAM3488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3488 was detected is described hereinabove with reference to Figs. 2–8.

[48791] VGAM3488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48792] VGAM3488 gene, herein designated VGAM GENE, encodes a VGAM3488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3488 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3488 precursor RNA is designated SEQ ID:79132, and is provided hereinbelow with reference to the sequence listing part.

[48793] VGAM3488 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48794] An enzyme complex designated DICER COMPLEX, dices the VGAM3488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3488 RNA is designated SEQ ID:79133, and is provided hereinbelow with reference to the sequence listing part.

[48795] VGAM3488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48796] VGAM3488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3488 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48797] The complementary binding of VGAM3488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3488 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48798] It is appreciated that VGAM3488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3488 host target genes. The mRNA of each one of this plurality of VGAM3488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3488 RNA, herein designated VGAM RNA, and which when bound by VGAM3488 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3488 host target proteins.

[48799] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3488 gene, herein designated VGAM GENE, on one or more VGAM3488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48800] It is yet further appreciated that a function of VGAM3488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3488 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3488 correlate with, and may be deduced from,

the identity of the host target genes which VGAM3488 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48801] Nucleotide sequences of the VGAM3488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3488 are further described hereinbelow with reference to Table 1.

[48802] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48803] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3489 (VGAM3489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48804] VGAM3489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3489 was detected is described hereinabove with reference to Figs. 2–8.

[48805] VGAM3489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48806] VGAM3489 gene, herein designated VGAM GENE, encodes a VGAM3489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3489 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3489 precursor RNA is designated SEQ ID:79141, and is provided hereinbelow with reference to the sequence listing part.

[48807] VGAM3489 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48808] An enzyme complex designated DICER COMPLEX, dices the VGAM3489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3489 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3489 RNA is designated SEQ ID:79142, and is provided hereinbelow with reference to the sequence listing part.

[48809] VGAM3489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48810] VGAM3489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3489 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48811] The complementary binding of VGAM3489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3489 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48812] It is appreciated that VGAM3489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3489 host target genes. The mRNA of each one of this plurality of VGAM3489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3489 RNA, herein designated VGAM RNA, and which when bound by VGAM3489 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3489 host target proteins.

[48813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3489 gene, herein designated VGAM GENE, on one or more VGAM3489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48814] It is yet further appreciated that a function of VGAM3489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3489 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3489 correlate with, and may be deduced from, the identity of the host target genes which VGAM3489 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[48815] Nucleotide sequences of the VGAM3489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3489 are further described hereinbelow with reference to Table 1.

[48816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48817] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3490 (VGAM3490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48818] VGAM3490 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3490 was detected is described hereinabove with reference to Figs. 2–8.

[48819] VGAM3490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM3490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48820] VGAM3490 gene, herein designated VGAM GENE, encodes a VGAM3490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3490 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3490 precursor RNA is designated SEQ ID:79144, and is provided hereinbelow with reference to the sequence listing part.

[48821] VGAM3490 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48822] An enzyme complex designated DICER COMPLEX, dices the VGAM3490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3490 RNA is designated SEQ ID:79145, and is provided hereinbelow with reference to the sequence listing part.

[48823] VGAM3490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48824] VGAM3490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3490 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[48825] The complementary binding of VGAM3490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3490 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48826] It is appreciated that VGAM3490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3490 host target genes. The mRNA of each one of this plurality of VGAM3490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3490 RNA, herein designated VGAM RNA, and which when bound by VGAM3490 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3490 host target proteins.

[48827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3490 gene, herein designated VGAM GENE, on one or more VGAM3490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48828] It is yet further appreciated that a function of VGAM3490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3490 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM3490 correlate with, and may be deduced from, the identity of the host target genes which VGAM3490 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[48829] Nucleotide sequences of the VGAM3490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3490 are further described hereinbelow with reference to Table 1.

[48830] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48831] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3491 (VGAM3491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48832] VGAM3491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3491 was detected is described hereinabove with reference to Figs. 2–8.

[48833] VGAM3491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM3491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48834] VGAM3491 gene, herein designated VGAM GENE, encodes a VGAM3491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3491 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3491 precursor RNA is designated SEQ ID:79150, and is provided hereinbelow with reference to the sequence listing part.

[48835] VGAM3491 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48836] An enzyme complex designated DICER COMPLEX, dices the VGAM3491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3491 RNA is designated SEQ ID:79151, and is provided hereinbelow with reference to the sequence listing part.

[48837] VGAM3491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[48838] VGAM3491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3491 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48839] The complementary binding of VGAM3491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3491 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48840] It is appreciated that VGAM3491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3491 host target genes. The mRNA of each one of this plurality of VGAM3491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3491 RNA, herein designated VGAM RNA, and which when bound by VGAM3491 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3491 host target proteins.

[48841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3491 gene, herein designated VGAM GENE, on one

or more VGAM3491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48842] It is yet further appreciated that a function of VGAM3491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3491 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3491 correlate with, and may be deduced from, the identity of the host target genes which VGAM3491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48843] Nucleotide sequences of the VGAM3491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3491 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3491 are further described hereinbelow with reference to Table 1.

[48844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48845] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3492 (VGAM3492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48846] VGAM3492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3492 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[48847] VGAM3492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip mosaic virus.

VGAM3492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48848] VGAM3492 gene, herein designated VGAM GENE, encodes a VGAM3492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3492 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3492 precursor RNA is designated SEQ ID:79187, and is provided hereinbelow with reference to the sequence listing part.

[48849] VGAM3492 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48850] An enzyme complex designated DICER COMPLEX, dices the VGAM3492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3492 RNA is designated SEQ ID:79188, and is provided hereinbelow with reference to the sequence listing part.

[48851] VGAM3492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48852] VGAM3492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3492 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48853] The complementary binding of VGAM3492 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3492 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48854] It is appreciated that VGAM3492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3492 host target genes. The mRNA of each one of this plurality of VGAM3492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3492 RNA, herein designated VGAM RNA, and which when bound by VGAM3492 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3492 host target proteins.

[48855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3492 gene, herein designated VGAM GENE, on one or more VGAM3492 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48856] It is yet further appreciated that a function of VGAM3492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3492 include diagnosis, prevention and treatment of viral infection by Turnip mosaic virus. Specific functions, and accordingly utilities, of VGAM3492 correlate with, and may be deduced from, the identity of the host target genes which VGAM3492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48857] Nucleotide sequences of the VGAM3492 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3492 are further described hereinbelow with reference to Table 1.

[48858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48859] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3493 (VGAM3493) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48860] VGAM3493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3493 was detected is described hereinabove with reference to Figs. 2-8.

[48861] VGAM3493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine parvovirus.

VGAM3493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48862] VGAM3493 gene, herein designated VGAM GENE, encodes a VGAM3493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3493 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3493 precursor RNA is designated SEQ ID:79193, and is provided hereinbelow with reference to the sequence listing part.

[48863] VGAM3493 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[48864] An enzyme complex designated DICER COMPLEX, dices the VGAM3493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3493 RNA is designated SEQ ID:79194, and is provided hereinbelow with reference to the sequence listing part.

[48865] VGAM3493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48866] VGAM3493 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3493 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48867] The complementary binding of VGAM3493 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3493 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48868] It is appreciated that VGAM3493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3493 host target genes. The mRNA of each one of this plurality of VGAM3493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3493 RNA, herein designated VGAM RNA, and which when bound by VGAM3493 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3493 host target proteins.

[48869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3493 gene, herein designated VGAM GENE, on one or more VGAM3493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48870] It is yet further appreciated that a function of VGAM3493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3493 include diagnosis, prevention and treatment of viral infection by Bovine parvovirus. Specific functions, and accordingly utilities, of VGAM3493 correlate with, and may be deduced from, the identity of the host target genes which VGAM3493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48871] Nucleotide sequences of the VGAM3493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3493 are further described hereinbelow with reference to Table 1.

[48872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48873] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3494 (VGAM3494) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48874] VGAM3494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3494 was detected is described hereinabove with reference to Figs. 2-8.

[48875] VGAM3494 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Lettuce mosaic virus. VGAM3494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48876] VGAM3494 gene, herein designated VGAM GENE, encodes a VGAM3494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3494 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3494 precursor RNA is designated SEQ ID:79198, and is provided hereinbelow with reference to the sequence listing part.

[48877] VGAM3494 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48878] An enzyme complex designated DICER COMPLEX, dices the VGAM3494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3494 RNA is designated SEQ ID:79199, and is provided hereinbelow with reference to the sequence listing part.

[48879] VGAM3494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3494 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48880] VGAM3494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3494 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48881] The complementary binding of VGAM3494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3494 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3494 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48882] It is appreciated that VGAM3494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3494 host target genes. The mRNA of each one of this plurality of VGAM3494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3494 RNA, herein designated VGAM RNA, and which when bound by VGAM3494 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3494 host target proteins.

[48883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3494 gene, herein designated VGAM GENE, on one or more VGAM3494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48884] It is yet further appreciated that a function of VGAM3494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3494 include diagnosis, prevention and treatment of viral infection by Lettuce mosaic virus. Specific functions, and accordingly utilities, of VGAM3494 correlate with, and may be deduced from, the identity of the host target genes which VGAM3494 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48885] Nucleotide sequences of the VGAM3494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3494 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3494 are further described hereinbelow with reference to Table 1.

[48886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48887] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3495 (VGAM3495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48888] VGAM3495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3495 was detected is described hereinabove with reference to Figs. 2-8.

[48889] VGAM3495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria

Chlorella virus 1. VGAM3495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48890] VGAM3495 gene, herein designated VGAM GENE, encodes a VGAM3495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3495 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3495 precursor RNA is designated SEQ ID:79207, and is provided hereinbelow with reference to the sequence listing part.

[48891] VGAM3495 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48892] An enzyme complex designated DICER COMPLEX, dices

the VGAM3495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3495 RNA is designated SEQ ID:79208, and is provided hereinbelow with reference to the sequence listing part.

[48893] VGAM3495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3495 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3495 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48894] VGAM3495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3495 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3495 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48895] The complementary binding of VGAM3495 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3495 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48896] It is appreciated that VGAM3495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3495 host target genes. The mRNA of each one of this plurality of VGAM3495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3495 RNA, herein designated VGAM RNA, and which when bound by VGAM3495 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3495 host target proteins.

[48897] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3495 gene, herein designated VGAM GENE, on one or more VGAM3495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48898] It is yet further appreciated that a function of VGAM3495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3495 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3495 correlate with, and may be deduced from, the identity of the host target genes which VGAM3495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48899] Nucleotide sequences of the VGAM3495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3495 are further described hereinbelow with reference to Table 1.

[48900] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48901] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3496 (VGAM3496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48902] VGAM3496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3496 was detected is described hereinabove with reference to Figs. 2-8.

[48903] VGAM3496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3496 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48904] VGAM3496 gene, herein designated VGAM GENE, encodes a VGAM3496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3496 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3496 precursor RNA is designated SEQ ID:79215, and is provided hereinbelow with reference to the sequence listing part.

[48905] VGAM3496 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48906] An enzyme complex designated DICER COMPLEX, dices the VGAM3496 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3496 RNA is designated SEQ ID:79216, and is provided hereinbelow with reference to the sequence listing part.

[48907] VGAM3496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3496 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48908] VGAM3496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3496 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3496 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48909] The complementary binding of VGAM3496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3496

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48910] It is appreciated that VGAM3496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3496 host target genes. The mRNA of each one of this plurality of VGAM3496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3496 RNA, herein designated VGAM RNA, and which when bound by VGAM3496 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3496 host target proteins.

[48911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3496 gene, herein designated VGAM GENE, on one or more VGAM3496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48912] It is yet further appreciated that a function of VGAM3496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3496 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3496 correlate with, and may be deduced from, the identity of the host target genes which VGAM3496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48913] Nucleotide sequences of the VGAM3496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3496 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3496 are further described hereinbelow with reference to Table 1.

[48914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3496 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48915] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3497 (VGAM3497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48916] VGAM3497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3497 was detected is described hereinabove with reference to Figs. 2-8.

[48917] VGAM3497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion mosaic virus. VGAM3497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[48918] VGAM3497 gene, herein designated VGAM GENE, encodes a VGAM3497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3497 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3497 precursor RNA is designated SEQ ID:79233, and is provided hereinbelow with reference to the sequence listing part.

[48919] VGAM3497 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48920] An enzyme complex designated DICER COMPLEX, dices the VGAM3497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3497 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3497 RNA is designated SEQ ID:79234, and is provided hereinbelow with reference to the sequence listing part.

[48921] VGAM3497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3497 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48922] VGAM3497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3497 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48923] The complementary binding of VGAM3497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3497 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48924] It is appreciated that VGAM3497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3497 host target genes. The mRNA of each one of this plurality of VGAM3497 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3497 RNA, herein designated VGAM RNA, and which when bound by VGAM3497 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3497 host target proteins.

[48925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3497 gene, herein designated VGAM GENE, on one or more VGAM3497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48926] It is yet further appreciated that a function of VGAM3497 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3497 include diagnosis, prevention and treatment of viral infection by Scallion mosaic virus. Specific functions, and accordingly utilities, of VGAM3497 correlate with, and may be deduced from, the identity of the host target genes which VGAM3497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48927] Nucleotide sequences of the VGAM3497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3497 are further

described hereinbelow with reference to Table 1.

[48928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48929] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3498 (VGAM3498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48930] VGAM3498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3498 was detected is described hereinabove with reference to Figs. 2-8.

[48931] VGAM3498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM3498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48932] VGAM3498 gene, herein designated VGAM GENE, encodes a VGAM3498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3498 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3498 precursor RNA is designated SEQ ID:79297, and is provided hereinbelow with reference to the sequence listing part.

[48933] VGAM3498 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[48934] An enzyme complex designated DICER COMPLEX, dices the VGAM3498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3498 RNA is designated SEQ ID:79298, and is provided hereinbelow with reference to the sequence listing part.

[48935] VGAM3498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48936] VGAM3498 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3498 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48937] The complementary binding of VGAM3498 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3498 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48938] It is appreciated that VGAM3498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3498 host target genes. The mRNA of each one of this plurality of VGAM3498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3498 RNA, herein designated VGAM RNA, and which when bound by VGAM3498 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3498 host target proteins.

[48939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3498 gene, herein designated VGAM GENE, on one or more VGAM3498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48940] It is yet further appreciated that a function of VGAM3498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3498 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM3498 correlate with, and may be deduced from, the identity of the host target genes which VGAM3498 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48941] Nucleotide sequences of the VGAM3498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3498 are further described hereinbelow with reference to Table 1.

[48942] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3498 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48943] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3499 (VGAM3499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48944] VGAM3499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3499 was detected is described hereinabove with reference to Figs. 2-8.

[48945] VGAM3499 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM3499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48946] VGAM3499 gene, herein designated VGAM GENE, encodes a VGAM3499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3499 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3499 precursor RNA is designated SEQ ID:79300, and is provided hereinbelow with reference to the sequence listing part.

[48947] VGAM3499 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48948] An enzyme complex designated DICER COMPLEX, dices the VGAM3499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3499 RNA is designated SEQ ID:79301, and is provided hereinbelow with reference to the sequence listing part.

[48949] VGAM3499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3499 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48950] VGAM3499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3499 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48951] The complementary binding of VGAM3499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3499 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3499 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48952] It is appreciated that VGAM3499 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3499 host target genes. The mRNA of each one of this plurality of VGAM3499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3499 RNA, herein designated VGAM RNA, and which when bound by VGAM3499 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3499 host target proteins.

[48953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3499 gene, herein designated VGAM GENE, on one or more VGAM3499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48954] It is yet further appreciated that a function of VGAM3499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3499 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM3499 correlate with, and may be deduced from, the identity of the host target genes which VGAM3499 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48955] Nucleotide sequences of the VGAM3499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3499 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3499 are further described hereinbelow with reference to Table 1.

[48956] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48957] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3500 (VGAM3500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48958] VGAM3500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3500 was detected is described hereinabove with reference to Figs. 2-8.

[48959] VGAM3500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D.

VGAM3500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48960] VGAM3500 gene, herein designated VGAM GENE, encodes a VGAM3500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3500 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3500 precursor RNA is designated SEQ ID:79307, and is provided hereinbelow with reference to the sequence listing part.

[48961] VGAM3500 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48962] An enzyme complex designated DICER COMPLEX, dices

the VGAM3500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3500 RNA is designated SEQ ID:79308, and is provided hereinbelow with reference to the sequence listing part.

[48963] VGAM3500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3500 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48964] VGAM3500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3500 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3500 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48965] The complementary binding of VGAM3500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3500 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48966] It is appreciated that VGAM3500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3500 host target genes. The mRNA of each one of this plurality of VGAM3500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3500 RNA, herein designated VGAM RNA, and which when bound by VGAM3500 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3500 host target proteins.

[48967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3500 gene, herein designated VGAM GENE, on one or more VGAM3500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48968] It is yet further appreciated that a function of VGAM3500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3500 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3500 correlate with, and may be deduced from, the identity of the host target genes which VGAM3500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48969] Nucleotide sequences of the VGAM3500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3500 are further described hereinbelow with reference to Table 1.

[48970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48971] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3501 (VGAM3501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48972] VGAM3501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3501 was detected is described hereinabove with reference to Figs. 2-8.

[48973] VGAM3501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM3501 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[48974] VGAM3501 gene, herein designated VGAM GENE, encodes a VGAM3501 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3501 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3501 precursor RNA is designated SEQ ID:79312, and is provided hereinbelow with reference to the sequence listing part.

[48975] VGAM3501 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48976] An enzyme complex designated DICER COMPLEX, dices the VGAM3501 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3501 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3501 RNA is designated SEQ ID:79313, and is provided hereinbelow with reference to the sequence listing part.

[48977] VGAM3501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3501 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48978] VGAM3501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3501 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3501 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48979] The complementary binding of VGAM3501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3501

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48980] It is appreciated that VGAM3501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3501 host target genes. The mRNA of each one of this plurality of VGAM3501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3501 RNA, herein designated VGAM RNA, and which when bound by VGAM3501 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3501 host target proteins.

[48981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3501 gene, herein designated VGAM GENE, on one or more VGAM3501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48982] It is yet further appreciated that a function of VGAM3501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3501 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM3501 correlate with, and may be deduced from, the identity of the host target genes which VGAM3501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48983] Nucleotide sequences of the VGAM3501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3501 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3501 are further described hereinbelow with reference to Table 1.

[48984] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48985] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3502 (VGAM3502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48986] VGAM3502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3502 was detected is described hereinabove with reference to Figs. 2-8.

[48987] VGAM3502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM3502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[48988] VGAM3502 gene, herein designated VGAM GENE, encodes a VGAM3502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3502 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3502 precursor RNA is designated SEQ ID:79318, and is provided hereinbelow with reference to the sequence listing part.

[48989] VGAM3502 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48990] An enzyme complex designated DICER COMPLEX, dices the VGAM3502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3502 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3502 RNA is designated SEQ ID:79319, and is provided hereinbelow with reference to the sequence listing part.

[48991] VGAM3502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3502 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[48992] VGAM3502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3502 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3502 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[48993] The complementary binding of VGAM3502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3502 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48994] It is appreciated that VGAM3502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3502 host target genes. The mRNA of each one of this plurality of VGAM3502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3502 RNA, herein designated VGAM RNA, and which when bound by VGAM3502 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3502 host target proteins.

[48995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3502 gene, herein designated VGAM GENE, on one or more VGAM3502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[48996] It is yet further appreciated that a function of VGAM3502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3502 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3502 correlate with, and may be deduced from, the identity of the host target genes which VGAM3502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48997] Nucleotide sequences of the VGAM3502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3502 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3502 are further

described hereinbelow with reference to Table 1.

[48998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48999] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3503 (VGAM3503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49000] VGAM3503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3503 was detected is described hereinabove with reference to Figs. 2-8.

[49001] VGAM3503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Black queen cell virus. VGAM3503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49002] VGAM3503 gene, herein designated VGAM GENE, encodes a VGAM3503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3503 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3503 precursor RNA is designated SEQ ID:79326, and is provided hereinbelow with reference to the sequence listing part.

[49003] VGAM3503 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49004] An enzyme complex designated DICER COMPLEX, dices the VGAM3503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3503 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3503 RNA is designated SEQ ID:79327, and is provided hereinbelow with reference to the sequence listing part.

[49005] VGAM3503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49006] VGAM3503 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3503 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49007] The complementary binding of VGAM3503 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3503 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3503 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49008] It is appreciated that VGAM3503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3503 host target genes. The mRNA of each one of this plurality of VGAM3503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3503 RNA, herein designated VGAM RNA, and which when bound by VGAM3503 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3503 host target proteins.

[49009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3503 gene, herein designated VGAM GENE, on one or more VGAM3503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49010] It is yet further appreciated that a function of VGAM3503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3503 include diagnosis, prevention and treatment of viral infection by Black queen cell virus. Specific functions, and accordingly utilities, of VGAM3503 correlate with, and may be deduced from, the identity of the host target genes which VGAM3503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49011] Nucleotide sequences of the VGAM3503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3503 are further described hereinbelow with reference to Table 1.

[49012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49013] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3504 (VGAM3504) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49014] VGAM3504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3504 was detected is described hereinabove with reference to Figs. 2-8.

[49015] VGAM3504 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49016] VGAM3504 gene, herein designated VGAM GENE, encodes

a VGAM3504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3504 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3504 precursor RNA is designated SEQ ID:79338, and is provided hereinbelow with reference to the sequence listing part.

[49017] VGAM3504 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49018] An enzyme complex designated DICER COMPLEX, dices the VGAM3504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3504 RNA is designated SEQ ID:79339, and is provided hereinbelow with reference to the sequence listing part.

[49019] VGAM3504 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49020] VGAM3504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3504 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49021] The complementary binding of VGAM3504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3504 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[49022] It is appreciated that VGAM3504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3504 host target genes. The mRNA of each one of this plurality of VGAM3504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3504 RNA, herein designated VGAM RNA, and which when bound by VGAM3504 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3504 host target proteins.

[49023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3504 gene, herein designated VGAM GENE, on one or more VGAM3504 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49024] It is yet further appreciated that a function of VGAM3504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3504 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3504 correlate with, and may be deduced from, the identity of the host target genes which VGAM3504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49025] Nucleotide sequences of the VGAM3504 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3504 are further described hereinbelow with reference to Table 1.

[49026] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49027] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3505 (VGAM3505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49028] VGAM3505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3505 was detected is described hereinabove with reference to Figs. 2-8.

[49029] VGAM3505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yam mosaic virus. VGAM3505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49030] VGAM3505 gene, herein designated VGAM GENE, encodes a VGAM3505 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3505 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3505 precursor RNA is designated SEQ ID:79343, and is provided hereinbelow with reference to the sequence listing part.

[49031] VGAM3505 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49032] An enzyme complex designated DICER COMPLEX, dices the VGAM3505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3505 RNA is designated SEQ ID:79344, and is provided hereinbelow with reference to the sequence listing part.

[49033] VGAM3505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49034] VGAM3505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3505 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49035] The complementary binding of VGAM3505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3505 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49036] It is appreciated that VGAM3505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3505 host target genes. The mRNA of each one of this plurality of VGAM3505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3505 RNA, herein designated VGAM RNA, and which when bound by VGAM3505 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3505 host target proteins.

[49037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3505 gene, herein designated VGAM GENE, on one or more VGAM3505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49038] It is yet further appreciated that a function of VGAM3505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3505 include diagnosis, prevention and treatment of viral infection by Yam mosaic virus. Specific functions, and accordingly utilities, of VGAM3505 correlate with, and may be deduced from, the identity of the host target genes which VGAM3505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49039] Nucleotide sequences of the VGAM3505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3505 are further described hereinbelow with reference to Table 1.

[49040] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3505 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49041] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3506 (VGAM3506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49042] VGAM3506 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3506 was detected is described hereinabove with reference to Figs. 2-8.

[49043] VGAM3506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yam mosaic virus. VGAM3506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49044] VGAM3506 gene, herein designated VGAM GENE, encodes a VGAM3506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3506 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3506 precursor RNA is designated SEQ ID:79355, and is provided hereinbelow with reference to the sequence listing part.

[49045] VGAM3506 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49046] An enzyme complex designated DICER COMPLEX, dices the VGAM3506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3506 RNA is designated SEQ ID:79356, and is provided hereinbelow with reference to the sequence listing part.

[49047] VGAM3506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49048] VGAM3506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3506 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49049] The complementary binding of VGAM3506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3506 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49050] It is appreciated that VGAM3506 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3506 host target genes. The mRNA of each one of this plurality of VGAM3506 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3506 RNA, herein designated VGAM RNA, and which when bound by VGAM3506 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3506 host target proteins.

[49051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3506 gene, herein designated VGAM GENE, on one or more VGAM3506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49052] It is yet further appreciated that a function of VGAM3506 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3506 include diagnosis, prevention and treatment of viral infection by Yam mosaic virus. Specific functions, and accordingly utilities, of VGAM3506 correlate with, and may be deduced from, the identity of the host target genes which VGAM3506 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49053] Nucleotide sequences of the VGAM3506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3506 are further described hereinbelow with reference to Table 1.

[49054] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3506 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49055] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3507 (VGAM3507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49056] VGAM3507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3507 was detected is described hereinabove with reference to Figs. 2–8.

[49057] VGAM3507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Soybean dwarf virus. VGAM3507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49058] VGAM3507 gene, herein designated VGAM GENE, encodes a VGAM3507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3507 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3507 precursor RNA is designated SEQ ID:79368, and is provided hereinbelow with reference to the sequence listing part.

[49059] VGAM3507 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49060] An enzyme complex designated DICER COMPLEX, dices the VGAM3507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3507 RNA is designated SEQ ID:79369, and is provided hereinbelow with reference to the sequence listing part.

[49061] VGAM3507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49062] VGAM3507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3507 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49063] The complementary binding of VGAM3507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3507 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49064] It is appreciated that VGAM3507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3507 host target genes. The mRNA of each one of this plurality of VGAM3507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3507 RNA, herein designated VGAM RNA, and which when bound by VGAM3507 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3507 host target proteins.

[49065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3507 gene, herein designated VGAM GENE, on one or more VGAM3507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [49066] It is yet further appreciated that a function of VGAM3507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3507 include diagnosis, prevention and treatment of viral infection by Soybean dwarf virus. Specific functions, and accordingly utilities, of VGAM3507 correlate with, and may be deduced from, the identity of the host target genes which VGAM3507 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [49067] Nucleotide sequences of the VGAM3507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3507 are further described hereinbelow with reference to Table 1.
- [49068] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49069] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3508 (VGAM3508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49070] VGAM3508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3508 was detected is described hereinabove with reference to Figs. 2-8.

[49071] VGAM3508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Soil-borne cereal mosaic virus. VGAM3508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49072] VGAM3508 gene, herein designated VGAM GENE, encodes a VGAM3508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3508 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3508 precursor RNA is designated SEQ ID:79383, and is provided hereinbelow with reference to the sequence listing part.

[49073] VGAM3508 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49074] An enzyme complex designated DICER COMPLEX, dices the VGAM3508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide se-

quence of VGAM3508 RNA is designated SEQ ID:79384, and is provided hereinbelow with reference to the sequence listing part.

[49075] VGAM3508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49076] VGAM3508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3508 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49077] The complementary binding of VGAM3508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3508 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49078] It is appreciated that VGAM3508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3508 host target genes. The mRNA of

each one of this plurality of VGAM3508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3508 RNA, herein designated VGAM RNA, and which when bound by VGAM3508 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3508 host target proteins.

[49079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3508 gene, herein designated VGAM GENE, on one or more VGAM3508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[49080] It is yet further appreciated that a function of VGAM3508 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3508 include diagnosis, prevention and treatment of viral infection by Soil-borne cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM3508 correlate with, and may be deduced from, the identity of the host target genes which VGAM3508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49081] Nucleotide sequences of the VGAM3508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3508 are further described hereinbelow with reference to Table 1.

[49082] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3508 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[49083] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3509 (VGAM3509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49084] VGAM3509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3509 was detected is described hereinabove with reference to Figs. 2–8.

[49085] VGAM3509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49086] VGAM3509 gene, herein designated VGAM GENE, encodes a VGAM3509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3509 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3509 precursor RNA is designated SEQ ID:79386, and is provided hereinbelow with reference to the sequence listing part.

[49087] VGAM3509 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49088] An enzyme complex designated DICER COMPLEX, dices the VGAM3509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3509 RNA is designated SEQ ID:79387,

and is provided hereinbelow with reference to the sequence listing part.

[49089] VGAM3509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49090] VGAM3509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3509 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49091] The complementary binding of VGAM3509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3509 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49092] It is appreciated that VGAM3509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3509 host target genes. The mRNA of each one of this plurality of VGAM3509 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3509 RNA, herein designated VGAM RNA, and which when bound by VGAM3509 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3509 host target proteins.

[49093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3509 gene, herein designated VGAM GENE, on one or more VGAM3509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49094] It is yet further appreciated that a function of VGAM3509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3509 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3509 correlate with, and may be deduced from, the identity of the host target genes which VGAM3509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49095] Nucleotide sequences of the VGAM3509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3509 are further described hereinbelow with reference to Table 1.

[49096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49097] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3510 (VGAM3510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49098] VGAM3510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3510 was detected is described hereinabove with reference to Figs. 2–8.

[49099] VGAM3510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM3510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49100] VGAM3510 gene, herein designated VGAM GENE, encodes a VGAM3510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3510 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3510 precursor

sor RNA is designated SEQ ID:79396, and is provided hereinbelow with reference to the sequence listing part.

[49101] VGAM3510 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49102] An enzyme complex designated DICER COMPLEX, dices the VGAM3510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3510 RNA is designated SEQ ID:79397, and is provided hereinbelow with reference to the se-

quence listing part.

[49103] VGAM3510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49104] VGAM3510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3510 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49105] The complementary binding of VGAM3510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3510 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49106] It is appreciated that VGAM3510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3510 host target genes. The mRNA of each one of this plurality of VGAM3510 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3510 RNA, herein designated VGAM RNA, and which when bound by VGAM3510 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3510 host target proteins.

[49107] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3510 gene, herein designated VGAM GENE, on one or more VGAM3510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49108] It is yet further appreciated that a function of VGAM3510

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3510 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3510 correlate with, and may be deduced from, the identity of the host target genes which VGAM3510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49109] Nucleotide sequences of the VGAM3510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3510 are further described hereinbelow with reference to Table 1.

[49110] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49111] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3511 (VGAM3511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49112] VGAM3511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3511 was detected is described hereinabove with reference to Figs. 2–8.

[49113] VGAM3511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49114] VGAM3511 gene, herein designated VGAM GENE, encodes a VGAM3511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3511 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3511 precursor RNA is designated SEQ ID:79403, and is provided

hereinbelow with reference to the sequence listing part.

[49115] VGAM3511 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49116] An enzyme complex designated DICER COMPLEX, dices the VGAM3511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3511 RNA is designated SEQ ID:79404, and is provided hereinbelow with reference to the sequence listing part.

[49117] VGAM3511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49118] VGAM3511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3511 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3511 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49119] The complementary binding of VGAM3511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3511 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49120] It is appreciated that VGAM3511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3511 host target genes. The mRNA of each one of this plurality of VGAM3511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3511 RNA, herein designated VGAM RNA, and which when bound by VGAM3511 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3511 host target proteins.

[49121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3511 gene, herein designated VGAM GENE, on one or more VGAM3511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49122] It is yet further appreciated that a function of VGAM3511 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3511 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3511 correlate with, and may be deduced from, the identity of the host target genes which VGAM3511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49123] Nucleotide sequences of the VGAM3511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3511 are further described hereinbelow with reference to Table 1.

[49124] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49125] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3512 (VGAM3512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49126] VGAM3512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3512 was detected is described hereinabove with reference to Figs. 2–8.

[49127] VGAM3512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chinese wheat mosaic virus. VGAM3512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49128] VGAM3512 gene, herein designated VGAM GENE, encodes a VGAM3512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3512 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3512 precursor RNA is designated SEQ ID:79409, and is provided hereinbelow with reference to the sequence listing part.

[49129] VGAM3512 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49130] An enzyme complex designated DICER COMPLEX, dices the VGAM3512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3512 RNA is designated SEQ ID:79410, and is provided hereinbelow with reference to the sequence listing part.

[49131] VGAM3512 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49132] VGAM3512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3512 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3512 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49133] The complementary binding of VGAM3512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3512 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49134] It is appreciated that VGAM3512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3512 host target genes. The mRNA of each one of this plurality of VGAM3512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3512 RNA, herein designated VGAM

RNA, and which when bound by VGAM3512 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3512 host target proteins.

[49135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3512 gene, herein designated VGAM GENE, on one or more VGAM3512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49136] It is yet further appreciated that a function of VGAM3512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3512 include diagnosis, prevention and treatment of viral infection by Chinese wheat mosaic virus. Specific functions, and accordingly utilities, of VGAM3512 correlate with, and may be deduced from, the identity of the host target genes which VGAM3512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49137] Nucleotide sequences of the VGAM3512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3512 are further described hereinbelow with reference to Table 1.

[49138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49139] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3513 (VGAM3513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49140] VGAM3513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3513 was detected is described hereinabove with reference to Figs. 2–8.

[49141] VGAM3513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM3513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49142] VGAM3513 gene, herein designated VGAM GENE, encodes a VGAM3513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3513 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3513 precursor RNA is designated SEQ ID:79419, and is provided hereinbelow with reference to the sequence listing part.

[49143] VGAM3513 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49144] An enzyme complex designated DICER COMPLEX, dices the VGAM3513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3513 RNA is designated SEQ ID:79420, and is provided hereinbelow with reference to the sequence listing part.

[49145] VGAM3513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3513 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49146] VGAM3513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3513 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3513 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3513 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49147] The complementary binding of VGAM3513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3513 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49148] It is appreciated that VGAM3513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3513 host target genes. The mRNA of each one of this plurality of VGAM3513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3513 RNA, herein designated VGAM RNA, and which when bound by VGAM3513 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3513 host target proteins.

[49149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3513 gene, herein designated VGAM GENE, on one or more VGAM3513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49150] It is yet further appreciated that a function of VGAM3513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3513 include diagnosis, prevention and

treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM3513 correlate with, and may be deduced from, the identity of the host target genes which VGAM3513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49151] Nucleotide sequences of the VGAM3513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3513 are further described hereinbelow with reference to Table 1.

[49152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49153] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3514 (VGAM3514) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49154] VGAM3514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3514 was detected is described hereinabove with reference to Figs. 2–8.

[49155] VGAM3514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya ringspot virus. VGAM3514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49156] VGAM3514 gene, herein designated VGAM GENE, encodes a VGAM3514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3514 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3514 precursor RNA is designated SEQ ID:79487, and is provided hereinbelow with reference to the sequence listing part.

[49157] VGAM3514 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3514 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49158] An enzyme complex designated DICER COMPLEX, dices the VGAM3514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3514 RNA is designated SEQ ID:79488, and is provided hereinbelow with reference to the sequence listing part.

[49159] VGAM3514 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3514 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3514 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49160] VGAM3514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3514 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3514 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49161] The complementary binding of VGAM3514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3514 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49162] It is appreciated that VGAM3514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3514 host target genes. The mRNA of each one of this plurality of VGAM3514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3514 RNA, herein designated VGAM RNA, and which when bound by VGAM3514 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3514 host target proteins.

[49163] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3514 gene, herein designated VGAM GENE, on one or more VGAM3514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49164] It is yet further appreciated that a function of VGAM3514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3514 include diagnosis, prevention and treatment of viral infection by Papaya ringspot virus. Spe-

cific functions, and accordingly utilities, of VGAM3514 correlate with, and may be deduced from, the identity of the host target genes which VGAM3514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49165] Nucleotide sequences of the VGAM3514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM3514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3514 are further described hereinbelow with reference to Table 1.

[49166] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49167] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3515 (VGAM3515) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[49168] VGAM3515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3515 was detected is described hereinabove with reference to Figs. 2–8.

[49169] VGAM3515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM3515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49170] VGAM3515 gene, herein designated VGAM GENE, encodes a VGAM3515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3515 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3515 precursor RNA is designated SEQ ID:79598, and is provided hereinbelow with reference to the sequence listing part.

[49171] VGAM3515 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3515 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49172] An enzyme complex designated DICER COMPLEX, dices the VGAM3515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3515 RNA is designated SEQ ID:79599, and is provided hereinbelow with reference to the sequence listing part.

[49173] VGAM3515 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3515 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3515 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49174] VGAM3515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3515 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49175] The complementary binding of VGAM3515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3515 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49176] It is appreciated that VGAM3515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3515 host target genes. The mRNA of each one of this plurality of VGAM3515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3515 RNA, herein designated VGAM RNA, and which when bound by VGAM3515 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3515 host target proteins.

[49177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3515 gene, herein designated VGAM GENE, on one or more VGAM3515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49178] It is yet further appreciated that a function of VGAM3515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3515 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM3515

correlate with, and may be deduced from, the identity of the host target genes which VGAM3515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49179] Nucleotide sequences of the VGAM3515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3515 are further described hereinbelow with reference to Table 1.

[49180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49181] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3516 (VGAM3516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[49182] VGAM3516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3516 was detected is described hereinabove with reference to Figs. 2–8.

[49183] VGAM3516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM3516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49184] VGAM3516 gene, herein designated VGAM GENE, encodes a VGAM3516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3516 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3516 precursor RNA is designated SEQ ID:79610, and is provided hereinbelow with reference to the sequence listing part.

[49185] VGAM3516 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49186] An enzyme complex designated DICER COMPLEX, dices the VGAM3516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3516 RNA is designated SEQ ID:79611, and is provided hereinbelow with reference to the sequence listing part.

[49187] VGAM3516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49188] VGAM3516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3516 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49189] The complementary binding of VGAM3516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3516 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49190] It is appreciated that VGAM3516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3516 host target genes. The mRNA of each one of this plurality of VGAM3516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3516 RNA, herein designated VGAM RNA, and which when bound by VGAM3516 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3516 host target proteins.

[49191] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3516 gene, herein designated VGAM GENE, on one or more VGAM3516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49192] It is yet further appreciated that a function of VGAM3516 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3516 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM3516 correlate with, and may be deduced from, the identity of

the host target genes which VGAM3516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49193] Nucleotide sequences of the VGAM3516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3516 are further described hereinbelow with reference to Table 1.

[49194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49195] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3517 (VGAM3517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49196] VGAM3517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3517 was detected is described hereinabove with reference to Figs. 2–8.

[49197] VGAM3517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox virus. VGAM3517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49198] VGAM3517 gene, herein designated VGAM GENE, encodes a VGAM3517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3517 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3517 precursor RNA is designated SEQ ID:79614, and is provided hereinbelow with reference to the sequence listing part.

[49199] VGAM3517 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49200] An enzyme complex designated DICER COMPLEX, dices the VGAM3517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3517 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3517 RNA is designated SEQ ID:79615, and is provided hereinbelow with reference to the sequence listing part.

[49201] VGAM3517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49202] VGAM3517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3517 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49203] The complementary binding of VGAM3517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3517 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49204] It is appreciated that VGAM3517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3517 host target genes. The mRNA of each one of this plurality of VGAM3517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3517 RNA, herein designated VGAM RNA, and which when bound by VGAM3517 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3517 host target proteins.

[49205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3517 gene, herein designated VGAM GENE, on one or more VGAM3517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49206] It is yet further appreciated that a function of VGAM3517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3517 include diagnosis, prevention and treatment of viral infection by Sheeppox virus. Specific functions, and accordingly utilities, of VGAM3517 correlate with, and may be deduced from, the identity of the host target genes which VGAM3517 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[49207] Nucleotide sequences of the VGAM3517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3517 are further described hereinbelow with reference to Table 1.

[49208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49209] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3518 (VGAM3518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49210] VGAM3518 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3518 was detected is described hereinabove with reference to Figs. 2-8.

[49211] VGAM3518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49212] VGAM3518 gene, herein designated VGAM GENE, encodes a VGAM3518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3518 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3518 precursor RNA is designated SEQ ID:79620, and is provided hereinbelow with reference to the sequence listing part.

[49213] VGAM3518 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49214] An enzyme complex designated DICER COMPLEX, dices the VGAM3518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3518 RNA is designated SEQ ID:79621, and is provided hereinbelow with reference to the sequence listing part.

[49215] VGAM3518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49216] VGAM3518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3518 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[49217] The complementary binding of VGAM3518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3518 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49218] It is appreciated that VGAM3518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3518 host target genes. The mRNA of each one of this plurality of VGAM3518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3518 RNA, herein designated VGAM RNA, and which when bound by VGAM3518 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3518 host target proteins.

[49219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3518 gene, herein designated VGAM GENE, on one or more VGAM3518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49220] It is yet further appreciated that a function of VGAM3518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3518 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3518 correlate with, and may be deduced from, the identity of the host target genes which VGAM3518 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[49221] Nucleotide sequences of the VGAM3518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3518 are further described hereinbelow with reference to Table 1.

[49222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3518 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49223] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3519 (VGAM3519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49224] VGAM3519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3519 was detected is described hereinabove with reference to Figs. 2–8.

[49225] VGAM3519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49226] VGAM3519 gene, herein designated VGAM GENE, encodes a VGAM3519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3519 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3519 precursor RNA is designated SEQ ID:79642, and is provided hereinbelow with reference to the sequence listing part.

[49227] VGAM3519 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49228] An enzyme complex designated DICER COMPLEX, dices the VGAM3519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3519 RNA is designated SEQ ID:79643, and is provided hereinbelow with reference to the sequence listing part.

[49229] VGAM3519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[49230] VGAM3519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3519 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49231] The complementary binding of VGAM3519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3519 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49232] It is appreciated that VGAM3519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3519 host target genes. The mRNA of each one of this plurality of VGAM3519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3519 RNA, herein designated VGAM RNA, and which when bound by VGAM3519 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3519 host target proteins.

[49233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3519 gene, herein designated VGAM GENE, on one

or more VGAM3519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49234] It is yet further appreciated that a function of VGAM3519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3519 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3519 correlate with, and may be deduced from, the identity of the host target genes which VGAM3519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49235] Nucleotide sequences of the VGAM3519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3519 are further described hereinbelow with reference to Table 1.

[49236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49237] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3520 (VGAM3520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49238] VGAM3520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3520 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[49239] VGAM3520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49240] VGAM3520 gene, herein designated VGAM GENE, encodes a VGAM3520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3520 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3520 precursor RNA is designated SEQ ID:79650, and is provided hereinbelow with reference to the sequence listing part.

[49241] VGAM3520 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49242] An enzyme complex designated DICER COMPLEX, dices the VGAM3520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3520 RNA is designated SEQ ID:79651, and is provided hereinbelow with reference to the sequence listing part.

[49243] VGAM3520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49244] VGAM3520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3520 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49245] The complementary binding of VGAM3520 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3520 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49246] It is appreciated that VGAM3520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3520 host target genes. The mRNA of each one of this plurality of VGAM3520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3520 RNA, herein designated VGAM RNA, and which when bound by VGAM3520 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3520 host target proteins.

[49247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3520 gene, herein designated VGAM GENE, on one or more VGAM3520 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49248] It is yet further appreciated that a function of VGAM3520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3520 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3520 correlate with, and may be deduced from, the identity of the host target genes which VGAM3520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49249] Nucleotide sequences of the VGAM3520 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3520 are further described hereinbelow with reference to Table 1.

[49250] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49251] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3521 (VGAM3521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49252] VGAM3521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3521 was detected is described hereinabove with reference to Figs. 2-8.

[49253] VGAM3521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM3521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49254] VGAM3521 gene, herein designated VGAM GENE, encodes a VGAM3521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3521 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3521 precursor RNA is designated SEQ ID:79712, and is provided hereinbelow with reference to the sequence listing part.

[49255] VGAM3521 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[49256] An enzyme complex designated DICER COMPLEX, dices the VGAM3521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3521 RNA is designated SEQ ID:79713, and is provided hereinbelow with reference to the sequence listing part.

[49257] VGAM3521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49258] VGAM3521 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3521 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49259] The complementary binding of VGAM3521 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3521 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49260] It is appreciated that VGAM3521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3521 host target genes. The mRNA of each one of this plurality of VGAM3521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3521 RNA, herein designated VGAM RNA, and which when bound by VGAM3521 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3521 host target proteins.

[49261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3521 gene, herein designated VGAM GENE, on one or more VGAM3521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49262] It is yet further appreciated that a function of VGAM3521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3521 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3521 correlate with, and may be deduced from, the identity of the host target genes which VGAM3521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49263] Nucleotide sequences of the VGAM3521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3521 are further described hereinbelow with reference to Table 1.

[49264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49265] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3522 (VGAM3522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49266] VGAM3522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3522 was detected is described hereinabove with reference to Figs. 2-8.

[49267] VGAM3522 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tobacco necrosis virus D. VGAM3522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49268] VGAM3522 gene, herein designated VGAM GENE, encodes a VGAM3522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3522 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3522 precursor RNA is designated SEQ ID:79724, and is provided hereinbelow with reference to the sequence listing part.

[49269] VGAM3522 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49270] An enzyme complex designated DICER COMPLEX, dices the VGAM3522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3522 RNA is designated SEQ ID:79725, and is provided hereinbelow with reference to the sequence listing part.

[49271] VGAM3522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3522 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49272] VGAM3522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3522 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49273] The complementary binding of VGAM3522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3522 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3522 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49274] It is appreciated that VGAM3522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3522 host target genes. The mRNA of each one of this plurality of VGAM3522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3522 RNA, herein designated VGAM RNA, and which when bound by VGAM3522 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3522 host target proteins.

[49275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3522 gene, herein designated VGAM GENE, on one or more VGAM3522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49276] It is yet further appreciated that a function of VGAM3522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3522 include diagnosis, prevention and treatment of viral infection by Tobacco necrosis virus D. Specific functions, and accordingly utilities, of VGAM3522 correlate with, and may be deduced from, the identity of the host target genes which VGAM3522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49277] Nucleotide sequences of the VGAM3522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3522 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3522 are further described hereinbelow with reference to Table 1.

[49278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3522 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49279] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3523 (VGAM3523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49280] VGAM3523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3523 was detected is described hereinabove with reference to Figs. 2-8.

[49281] VGAM3523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2.

VGAM3523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49282] VGAM3523 gene, herein designated VGAM GENE, encodes a VGAM3523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3523 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3523 precursor RNA is designated SEQ ID:79728, and is provided hereinbelow with reference to the sequence listing part.

[49283] VGAM3523 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49284] An enzyme complex designated DICER COMPLEX, dices

the VGAM3523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3523 RNA is designated SEQ ID:79729, and is provided hereinbelow with reference to the sequence listing part.

[49285] VGAM3523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3523 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49286] VGAM3523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3523 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3523 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49287] The complementary binding of VGAM3523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3523 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49288] It is appreciated that VGAM3523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3523 host target genes. The mRNA of each one of this plurality of VGAM3523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3523 RNA, herein designated VGAM RNA, and which when bound by VGAM3523 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3523 host target proteins.

[49289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3523 gene, herein designated VGAM GENE, on one or more VGAM3523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49290] It is yet further appreciated that a function of VGAM3523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3523 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3523 correlate with, and may be deduced from, the identity of the host target genes which VGAM3523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49291] Nucleotide sequences of the VGAM3523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3523 are further described hereinbelow with reference to Table 1.

[49292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49293] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3524 (VGAM3524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49294] VGAM3524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3524 was detected is described hereinabove with reference to Figs. 2-8.

[49295] VGAM3524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea enation mosaic virus-2. VGAM3524 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49296] VGAM3524 gene, herein designated VGAM GENE, encodes a VGAM3524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3524 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3524 precursor RNA is designated SEQ ID:79738, and is provided hereinbelow with reference to the sequence listing part.

[49297] VGAM3524 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49298] An enzyme complex designated DICER COMPLEX, dices the VGAM3524 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3524 RNA is designated SEQ ID:79739, and is provided hereinbelow with reference to the sequence listing part.

[49299] VGAM3524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3524 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49300] VGAM3524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3524 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3524 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49301] The complementary binding of VGAM3524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3524

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49302] It is appreciated that VGAM3524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3524 host target genes. The mRNA of each one of this plurality of VGAM3524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3524 RNA, herein designated VGAM RNA, and which when bound by VGAM3524 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3524 host target proteins.

[49303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3524 gene, herein designated VGAM GENE, on one or more VGAM3524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49304] It is yet further appreciated that a function of VGAM3524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3524 include diagnosis, prevention and treatment of viral infection by Pea enation mosaic virus-2. Specific functions, and accordingly utilities, of VGAM3524 correlate with, and may be deduced from, the identity of the host target genes which VGAM3524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49305] Nucleotide sequences of the VGAM3524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3524 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3524 are further described hereinbelow with reference to Table 1.

[49306] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49307] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3525 (VGAM3525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49308] VGAM3525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3525 was detected is described hereinabove with reference to Figs. 2-8.

[49309] VGAM3525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Periplaneta fuliginosa densovirus. VGAM3525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[49310] VGAM3525 gene, herein designated VGAM GENE, encodes a VGAM3525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3525 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3525 precursor RNA is designated SEQ ID:79771, and is provided hereinbelow with reference to the sequence listing part.

[49311] VGAM3525 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49312] An enzyme complex designated DICER COMPLEX, dices the VGAM3525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3525 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3525 RNA is designated SEQ ID:79772, and is provided hereinbelow with reference to the sequence listing part.

[49313] VGAM3525 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3525 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49314] VGAM3525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3525 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49315] The complementary binding of VGAM3525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3525 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3525 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49316] It is appreciated that VGAM3525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3525 host target genes. The mRNA of each one of this plurality of VGAM3525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3525 RNA, herein designated VGAM RNA, and which when bound by VGAM3525 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3525 host target proteins.

[49317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3525 gene, herein designated VGAM GENE, on one or more VGAM3525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49318] It is yet further appreciated that a function of VGAM3525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3525 include diagnosis, prevention and treatment of viral infection by Periplaneta fuliginosa densovirus. Specific functions, and accordingly utilities, of VGAM3525 correlate with, and may be deduced from, the identity of the host target genes which VGAM3525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49319] Nucleotide sequences of the VGAM3525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3525 are further

described hereinbelow with reference to Table 1.

[49320] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49321] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3526 (VGAM3526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49322] VGAM3526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3526 was detected is described hereinabove with reference to Figs. 2-8.

[49323] VGAM3526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49324] VGAM3526 gene, herein designated VGAM GENE, encodes a VGAM3526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3526 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3526 precursor RNA is designated SEQ ID:79794, and is provided hereinbelow with reference to the sequence listing part.

[49325] VGAM3526 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49326] An enzyme complex designated DICER COMPLEX, dices the VGAM3526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3526 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3526 RNA is designated SEQ ID:79795, and is provided hereinbelow with reference to the sequence listing part.

[49327] VGAM3526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49328] VGAM3526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3526 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49329] The complementary binding of VGAM3526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3526 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3526 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49330] It is appreciated that VGAM3526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3526 host target genes. The mRNA of each one of this plurality of VGAM3526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3526 RNA, herein designated VGAM RNA, and which when bound by VGAM3526 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3526 host target proteins.

[49331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3526 gene, herein designated VGAM GENE, on one or more VGAM3526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49332] It is yet further appreciated that a function of VGAM3526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3526 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3526 correlate with, and may be deduced from, the identity of the host target genes which VGAM3526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49333] Nucleotide sequences of the VGAM3526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3526 are further described hereinbelow with reference to Table 1.

[49334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49335] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3527 (VGAM3527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49336] VGAM3527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3527 was detected is described hereinabove with reference to Figs. 2-8.

[49337] VGAM3527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3527 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49338] VGAM3527 gene, herein designated VGAM GENE, encodes

a VGAM3527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3527 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3527 precursor RNA is designated SEQ ID:79812, and is provided hereinbelow with reference to the sequence listing part.

[49339] VGAM3527 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49340] An enzyme complex designated DICER COMPLEX, dices the VGAM3527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3527 RNA is designated SEQ ID:79813, and is provided hereinbelow with reference to the sequence listing part.

[49341] VGAM3527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49342] VGAM3527 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3527 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49343] The complementary binding of VGAM3527 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3527 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[49344] It is appreciated that VGAM3527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3527 host target genes. The mRNA of each one of this plurality of VGAM3527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3527 RNA, herein designated VGAM RNA, and which when bound by VGAM3527 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3527 host target proteins.

[49345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3527 gene, herein designated VGAM GENE, on one or more VGAM3527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49346] It is yet further appreciated that a function of VGAM3527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3527 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3527 correlate with, and may be deduced from, the identity of the host target genes which VGAM3527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49347] Nucleotide sequences of the VGAM3527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3527 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3527 are further described hereinbelow with reference to Table 1.

[49348] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49349] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3528 (VGAM3528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49350] VGAM3528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3528 was detected is described hereinabove with reference to Figs. 2-8.

[49351] VGAM3528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM3528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49352] VGAM3528 gene, herein designated VGAM GENE, encodes a VGAM3528 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3528 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3528 precursor RNA is designated SEQ ID:79815, and is provided hereinbelow with reference to the sequence listing part.

[49353] VGAM3528 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49354] An enzyme complex designated DICER COMPLEX, dices the VGAM3528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3528 RNA is designated SEQ ID:79816, and is provided hereinbelow with reference to the sequence listing part.

[49355] VGAM3528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49356] VGAM3528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3528 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49357] The complementary binding of VGAM3528 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3528 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49358] It is appreciated that VGAM3528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3528 host target genes. The mRNA of each one of this plurality of VGAM3528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3528 RNA, herein designated VGAM RNA, and which when bound by VGAM3528 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3528 host target proteins.

[49359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3528 gene, herein designated VGAM GENE, on one or more VGAM3528 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49360] It is yet further appreciated that a function of VGAM3528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3528 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM3528 correlate with, and may be deduced from, the identity of the host target genes which VGAM3528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49361] Nucleotide sequences of the VGAM3528 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3528 are further described hereinbelow with reference to Table 1.

[49362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49363] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3529 (VGAM3529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49364] VGAM3529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3529 was detected is described hereinabove with reference to Figs. 2-8.

[49365] VGAM3529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM3529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49366] VGAM3529 gene, herein designated VGAM GENE, encodes a VGAM3529 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3529 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3529 precursor RNA is designated SEQ ID:79822, and is provided hereinbelow with reference to the sequence listing part.

[49367] VGAM3529 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49368] An enzyme complex designated DICER COMPLEX, dices the VGAM3529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3529 RNA is designated SEQ ID:79823, and is provided hereinbelow with reference to the sequence listing part.

[49369] VGAM3529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49370] VGAM3529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3529 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49371] The complementary binding of VGAM3529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3529 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49372] It is appreciated that VGAM3529 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3529 host target genes. The mRNA of each one of this plurality of VGAM3529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3529 RNA, herein designated VGAM RNA, and which when bound by VGAM3529 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3529 host target proteins.

[49373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3529 gene, herein designated VGAM GENE, on one or more VGAM3529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49374] It is yet further appreciated that a function of VGAM3529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3529 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3529 correlate with, and may be deduced from, the identity of the host target genes which VGAM3529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49375] Nucleotide sequences of the VGAM3529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3529 are further described hereinbelow with reference to Table 1.

[49376] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49377] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3530 (VGAM3530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49378] VGAM3530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3530 was detected is described hereinabove with reference to Figs. 2–8.

[49379] VGAM3530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM3530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49380] VGAM3530 gene, herein designated VGAM GENE, encodes a VGAM3530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3530 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3530 precursor RNA is designated SEQ ID:79831, and is provided hereinbelow with reference to the sequence listing part.

[49381] VGAM3530 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49382] An enzyme complex designated DICER COMPLEX, dices the VGAM3530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3530 RNA is designated SEQ ID:79832, and is provided hereinbelow with reference to the sequence listing part.

[49383] VGAM3530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49384] VGAM3530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3530 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49385] The complementary binding of VGAM3530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3530 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49386] It is appreciated that VGAM3530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3530 host target genes. The mRNA of each one of this plurality of VGAM3530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3530 RNA, herein designated VGAM RNA, and which when bound by VGAM3530 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3530 host target proteins.

[49387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3530 gene, herein designated VGAM GENE, on one or more VGAM3530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [49388] It is yet further appreciated that a function of VGAM3530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3530 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM3530 correlate with, and may be deduced from, the identity of the host target genes which VGAM3530 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [49389] Nucleotide sequences of the VGAM3530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3530 are further described hereinbelow with reference to Table 1.
- [49390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49391] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3531 (VGAM3531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49392] VGAM3531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3531 was detected is described hereinabove with reference to Figs. 2-8.

[49393] VGAM3531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49394] VGAM3531 gene, herein designated VGAM GENE, encodes a VGAM3531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3531 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3531 precursor RNA is designated SEQ ID:79836, and is provided hereinbelow with reference to the sequence listing part.

[49395] VGAM3531 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49396] An enzyme complex designated DICER COMPLEX, dices the VGAM3531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM3531 RNA is designated SEQ ID:79837, and is provided hereinbelow with reference to the sequence listing part.

[49397] VGAM3531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49398] VGAM3531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3531 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49399] The complementary binding of VGAM3531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3531 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49400] It is appreciated that VGAM3531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3531 host target genes. The mRNA of

each one of this plurality of VGAM3531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3531 RNA, herein designated VGAM RNA, and which when bound by VGAM3531 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3531 host target proteins.

[49401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3531 gene, herein designated VGAM GENE, on one or more VGAM3531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[49402] It is yet further appreciated that a function of VGAM3531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3531 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3531 correlate with, and may be deduced from, the identity of the host target genes which VGAM3531 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49403] Nucleotide sequences of the VGAM3531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3531 are further described hereinbelow with reference to Table 1.

[49404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3531 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[49405] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3532 (VGAM3532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49406] VGAM3532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3532 was detected is described hereinabove with reference to Figs. 2–8.

[49407] VGAM3532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM3532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49408] VGAM3532 gene, herein designated VGAM GENE, encodes a VGAM3532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3532 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3532 precursor RNA is designated SEQ ID:79852, and is provided hereinbelow with reference to the sequence listing part.

[49409] VGAM3532 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49410] An enzyme complex designated DICER COMPLEX, dices the VGAM3532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3532 RNA is designated SEQ ID:79853,

and is provided hereinbelow with reference to the sequence listing part.

[49411] VGAM3532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49412] VGAM3532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3532 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49413] The complementary binding of VGAM3532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3532 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49414] It is appreciated that VGAM3532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3532 host target genes. The mRNA of each one of this plurality of VGAM3532 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3532 RNA, herein designated VGAM RNA, and which when bound by VGAM3532 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3532 host target proteins.

[49415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3532 gene, herein designated VGAM GENE, on one or more VGAM3532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49416] It is yet further appreciated that a function of VGAM3532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3532 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM3532 correlate with, and may be deduced from, the identity of the host target genes which VGAM3532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49417] Nucleotide sequences of the VGAM3532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3532 are further described hereinbelow with reference to Table 1.

[49418] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49419] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3533 (VGAM3533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49420] VGAM3533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3533 was detected is described hereinabove with reference to Figs. 2–8.

[49421] VGAM3533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49422] VGAM3533 gene, herein designated VGAM GENE, encodes a VGAM3533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3533 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3533 precu-

sor RNA is designated SEQ ID:79879, and is provided hereinbelow with reference to the sequence listing part.

[49423] VGAM3533 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49424] An enzyme complex designated DICER COMPLEX, dices the VGAM3533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3533 RNA is designated SEQ ID:79880, and is provided hereinbelow with reference to the se-

quence listing part.

[49425] VGAM3533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49426] VGAM3533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3533 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49427] The complementary binding of VGAM3533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3533 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49428] It is appreciated that VGAM3533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3533 host target genes. The mRNA of each one of this plurality of VGAM3533 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3533 RNA, herein designated VGAM RNA, and which when bound by VGAM3533 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3533 host target proteins.

[49429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3533 gene, herein designated VGAM GENE, on one or more VGAM3533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49430] It is yet further appreciated that a function of VGAM3533

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3533 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3533 correlate with, and may be deduced from, the identity of the host target genes which VGAM3533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49431] Nucleotide sequences of the VGAM3533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3533 are further described hereinbelow with reference to Table 1.

[49432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49433] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3534 (VGAM3534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49434] VGAM3534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3534 was detected is described hereinabove with reference to Figs. 2–8.

[49435] VGAM3534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49436] VGAM3534 gene, herein designated VGAM GENE, encodes a VGAM3534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3534 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3534 precursor RNA is designated SEQ ID:79896, and is provided

hereinbelow with reference to the sequence listing part.

[49437] VGAM3534 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49438] An enzyme complex designated DICER COMPLEX, dices the VGAM3534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3534 RNA is designated SEQ ID:79897, and is provided hereinbelow with reference to the sequence listing part.

[49439] VGAM3534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49440] VGAM3534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3534 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3534 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49441] The complementary binding of VGAM3534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3534 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49442] It is appreciated that VGAM3534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3534 host target genes. The mRNA of each one of this plurality of VGAM3534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3534 RNA, herein designated VGAM RNA, and which when bound by VGAM3534 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3534 host target proteins.

[49443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3534 gene, herein designated VGAM GENE, on one or more VGAM3534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49444] It is yet further appreciated that a function of VGAM3534 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3534 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2.

Specific functions, and accordingly utilities, of VGAM3534 correlate with, and may be deduced from, the identity of the host target genes which VGAM3534 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49445] Nucleotide sequences of the VGAM3534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3534 are further described hereinbelow with reference to Table 1.

[49446] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49447] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3535 (VGAM3535) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49448] VGAM3535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3535 was detected is described hereinabove with reference to Figs. 2–8.

[49449] VGAM3535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper ringspot virus. VGAM3535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49450] VGAM3535 gene, herein designated VGAM GENE, encodes a VGAM3535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3535 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3535 precursor RNA is designated SEQ ID:79916, and is provided hereinbelow with reference to the sequence listing part.

[49451] VGAM3535 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49452] An enzyme complex designated DICER COMPLEX, dices the VGAM3535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3535 RNA is designated SEQ ID:79917, and is provided hereinbelow with reference to the sequence listing part.

[49453] VGAM3535 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49454] VGAM3535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3535 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3535 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49455] The complementary binding of VGAM3535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3535 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49456] It is appreciated that VGAM3535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3535 host target genes. The mRNA of each one of this plurality of VGAM3535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3535 RNA, herein designated VGAM

RNA, and which when bound by VGAM3535 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3535 host target proteins.

[49457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3535 gene, herein designated VGAM GENE, on one or more VGAM3535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49458] It is yet further appreciated that a function of VGAM3535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3535 include diagnosis, prevention and treatment of viral infection by Pepper ringspot virus. Specific functions, and accordingly utilities, of VGAM3535 correlate with, and may be deduced from, the identity of the host target genes which VGAM3535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49459] Nucleotide sequences of the VGAM3535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3535 are further described hereinbelow with reference to Table 1.

[49460] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49461] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3536 (VGAM3536) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49462] VGAM3536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3536 was detected is described hereinabove with reference to Figs. 2-8.

[49463] VGAM3536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 19. VGAM3536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49464] VGAM3536 gene, herein designated VGAM GENE, encodes a VGAM3536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3536 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3536 precursor RNA is designated SEQ ID:79920, and is provided hereinbelow with reference to the sequence listing part.

[49465] VGAM3536 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49466] An enzyme complex designated DICER COMPLEX, dices the VGAM3536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3536 RNA is designated SEQ ID:79921, and is provided hereinbelow with reference to the sequence listing part.

[49467] VGAM3536 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3536 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49468] VGAM3536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3536 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3536 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3536 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49469] The complementary binding of VGAM3536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3536 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49470] It is appreciated that VGAM3536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3536 host target genes. The mRNA of each one of this plurality of VGAM3536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3536 RNA, herein designated VGAM RNA, and which when bound by VGAM3536 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3536 host target proteins.

[49471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3536 gene, herein designated VGAM GENE, on one or more VGAM3536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49472] It is yet further appreciated that a function of VGAM3536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3536 include diagnosis, prevention and

treatment of viral infection by Human papillomavirus type 19. Specific functions, and accordingly utilities, of VGAM3536 correlate with, and may be deduced from, the identity of the host target genes which VGAM3536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49473] Nucleotide sequences of the VGAM3536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3536 are further described hereinbelow with reference to Table 1.

[49474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49475] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3537 (VGAM3537) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49476] VGAM3537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3537 was detected is described hereinabove with reference to Figs. 2–8.

[49477] VGAM3537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 19. VGAM3537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49478] VGAM3537 gene, herein designated VGAM GENE, encodes a VGAM3537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3537 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3537 precursor RNA is designated SEQ ID:79928, and is provided hereinbelow with reference to the sequence listing part.

[49479] VGAM3537 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3537 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49480] An enzyme complex designated DICER COMPLEX, dices the VGAM3537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3537 RNA is designated SEQ ID:79929, and is provided hereinbelow with reference to the sequence listing part.

[49481] VGAM3537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3537 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3537 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49482] VGAM3537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3537 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3537 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3537 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49483] The complementary binding of VGAM3537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3537 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49484] It is appreciated that VGAM3537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3537 host target genes. The mRNA of each one of this plurality of VGAM3537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3537 RNA, herein designated VGAM RNA, and which when bound by VGAM3537 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3537 host target proteins.

[49485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3537 gene, herein designated VGAM GENE, on one or more VGAM3537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49486] It is yet further appreciated that a function of VGAM3537 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3537 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type

19. Specific functions, and accordingly utilities, of VGAM3537 correlate with, and may be deduced from, the identity of the host target genes which VGAM3537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49487] Nucleotide sequences of the VGAM3537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3537 are further described hereinbelow with reference to Table 1.

[49488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49489] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3538 (VGAM3538) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[49490] VGAM3538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3538 was detected is described hereinabove with reference to Figs. 2–8.

[49491] VGAM3538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 25. VGAM3538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49492] VGAM3538 gene, herein designated VGAM GENE, encodes a VGAM3538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3538 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3538 precursor RNA is designated SEQ ID:79936, and is provided hereinbelow with reference to the sequence listing part.

[49493] VGAM3538 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3538 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49494] An enzyme complex designated DICER COMPLEX, dices the VGAM3538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3538 RNA is designated SEQ ID:79937, and is provided hereinbelow with reference to the sequence listing part.

[49495] VGAM3538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3538 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49496] VGAM3538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3538 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49497] The complementary binding of VGAM3538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3538 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49498] It is appreciated that VGAM3538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3538 host target genes. The mRNA of each one of this plurality of VGAM3538 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3538 RNA, herein designated VGAM RNA, and which when bound by VGAM3538 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3538 host target proteins.

[49499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3538 gene, herein designated VGAM GENE, on one or more VGAM3538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49500] It is yet further appreciated that a function of VGAM3538 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3538 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 25. Specific functions, and accordingly utilities, of

VGAM3538 correlate with, and may be deduced from, the identity of the host target genes which VGAM3538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49501] Nucleotide sequences of the VGAM3538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3538 are further described hereinbelow with reference to Table 1.

[49502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49503] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3539 (VGAM3539) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[49504] VGAM3539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3539 was detected is described hereinabove with reference to Figs. 2–8.

[49505] VGAM3539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 20. VGAM3539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49506] VGAM3539 gene, herein designated VGAM GENE, encodes a VGAM3539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3539 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3539 precursor RNA is designated SEQ ID:79963, and is provided hereinbelow with reference to the sequence listing part.

[49507] VGAM3539 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49508] An enzyme complex designated DICER COMPLEX, dices the VGAM3539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3539 RNA is designated SEQ ID:79964, and is provided hereinbelow with reference to the sequence listing part.

[49509] VGAM3539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49510] VGAM3539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3539 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49511] The complementary binding of VGAM3539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3539 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49512] It is appreciated that VGAM3539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3539 host target genes. The mRNA of each one of this plurality of VGAM3539 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3539 RNA, herein designated VGAM RNA, and which when bound by VGAM3539 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3539 host target proteins.

[49513] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3539 gene, herein designated VGAM GENE, on one or more VGAM3539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49514] It is yet further appreciated that a function of VGAM3539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3539 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 20. Specific functions, and accordingly utilities, of VGAM3539 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49515] Nucleotide sequences of the VGAM3539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3539 are further described hereinbelow with reference to Table 1.

[49516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49517] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3540 (VGAM3540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49518] VGAM3540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3540 was detected is described hereinabove with reference to Figs. 2–8.

[49519] VGAM3540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 23. VGAM3540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49520] VGAM3540 gene, herein designated VGAM GENE, encodes a VGAM3540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3540 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3540 precursor RNA is designated SEQ ID:80370, and is provided hereinbelow with reference to the sequence listing part.

[49521] VGAM3540 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49522] An enzyme complex designated DICER COMPLEX, dices the VGAM3540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3540 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3540 RNA is designated SEQ ID:80371, and is provided hereinbelow with reference to the sequence listing part.

[49523] VGAM3540 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49524] VGAM3540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3540 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49525] The complementary binding of VGAM3540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3540 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49526] It is appreciated that VGAM3540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3540 host target genes. The mRNA of each one of this plurality of VGAM3540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3540 RNA, herein designated VGAM RNA, and which when bound by VGAM3540 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3540 host target proteins.

[49527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3540 gene, herein designated VGAM GENE, on one or more VGAM3540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49528] It is yet further appreciated that a function of VGAM3540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3540 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 23. Specific functions, and accordingly utilities, of VGAM3540 correlate with, and may be deduced from, the identity of the host target genes which VGAM3540 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49529] Nucleotide sequences of the VGAM3540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3540 are further described hereinbelow with reference to Table 1.

[49530] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3540 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49531] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3541 (VGAM3541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49532] VGAM3541 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3541 was detected is described hereinabove with reference to Figs. 2–8.

[49533] VGAM3541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 36. VGAM3541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49534] VGAM3541 gene, herein designated VGAM GENE, encodes a VGAM3541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3541 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3541 precursor RNA is designated SEQ ID:80374, and is provided hereinbelow with reference to the sequence listing part.

[49535] VGAM3541 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49536] An enzyme complex designated DICER COMPLEX, dices the VGAM3541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3541 RNA is designated SEQ ID:80375, and is provided hereinbelow with reference to the sequence listing part.

[49537] VGAM3541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49538] VGAM3541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3541 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[49539] The complementary binding of VGAM3541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3541 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49540] It is appreciated that VGAM3541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3541 host target genes. The mRNA of each one of this plurality of VGAM3541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3541 RNA, herein designated VGAM RNA, and which when bound by VGAM3541 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3541 host target proteins.

[49541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3541 gene, herein designated VGAM GENE, on one or more VGAM3541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49542] It is yet further appreciated that a function of VGAM3541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3541 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 36. Specific functions, and accordingly utilities, of VGAM3541 correlate with, and may be deduced from, the identity of the host target genes which VGAM3541 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[49543] Nucleotide sequences of the VGAM3541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3541 are further described hereinbelow with reference to Table 1.

[49544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49545] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3542 (VGAM3542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49546] VGAM3542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3542 was detected is described hereinabove with reference to Figs. 2–8.

[49547] VGAM3542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 49. VGAM3542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49548] VGAM3542 gene, herein designated VGAM GENE, encodes a VGAM3542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3542 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3542 precursor RNA is designated SEQ ID:80390, and is provided hereinbelow with reference to the sequence listing part.

[49549] VGAM3542 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49550] An enzyme complex designated DICER COMPLEX, dices the VGAM3542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3542 RNA is designated SEQ ID:80391, and is provided hereinbelow with reference to the sequence listing part.

[49551] VGAM3542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[49552] VGAM3542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3542 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3542 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49553] The complementary binding of VGAM3542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3542 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49554] It is appreciated that VGAM3542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3542 host target genes. The mRNA of each one of this plurality of VGAM3542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3542 RNA, herein designated VGAM RNA, and which when bound by VGAM3542 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3542 host target proteins.

[49555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3542 gene, herein designated VGAM GENE, on one

or more VGAM3542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49556] It is yet further appreciated that a function of VGAM3542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3542 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 49. Specific functions, and accordingly utilities, of VGAM3542 correlate with, and may be deduced from, the identity of the host target genes which VGAM3542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49557] Nucleotide sequences of the VGAM3542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3542 are further described hereinbelow with reference to Table 1.

[49558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49559] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3543 (VGAM3543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49560] VGAM3543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3543 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[49561] VGAM3543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 9. VGAM3543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49562] VGAM3543 gene, herein designated VGAM GENE, encodes a VGAM3543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3543 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3543 precursor RNA is designated SEQ ID:80397, and is provided hereinbelow with reference to the sequence listing part.

[49563] VGAM3543 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49564] An enzyme complex designated DICER COMPLEX, dices the VGAM3543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3543 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3543 RNA is designated SEQ ID:80398, and is provided hereinbelow with reference to the sequence listing part.

[49565] VGAM3543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49566] VGAM3543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3543 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49567] The complementary binding of VGAM3543 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3543 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49568] It is appreciated that VGAM3543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3543 host target genes. The mRNA of each one of this plurality of VGAM3543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3543 RNA, herein designated VGAM RNA, and which when bound by VGAM3543 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3543 host target proteins.

[49569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3543 gene, herein designated VGAM GENE, on one or more VGAM3543 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49570] It is yet further appreciated that a function of VGAM3543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3543 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 9. Specific functions, and accordingly utilities, of VGAM3543 correlate with, and may be deduced from, the identity of the host target genes which VGAM3543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49571] Nucleotide sequences of the VGAM3543 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3543 are further described hereinbelow with reference to Table 1.

[49572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49573] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3544 (VGAM3544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49574] VGAM3544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3544 was detected is described hereinabove with reference to Figs. 2-8.

[49575] VGAM3544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM3544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49576] VGAM3544 gene, herein designated VGAM GENE, encodes a VGAM3544 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3544 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3544 precursor RNA is designated SEQ ID:80405, and is provided hereinbelow with reference to the sequence listing part.

[49577] VGAM3544 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[49578] An enzyme complex designated DICER COMPLEX, dices the VGAM3544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3544 RNA is designated SEQ ID:80406, and is provided hereinbelow with reference to the sequence listing part.

[49579] VGAM3544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49580] VGAM3544 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3544 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49581] The complementary binding of VGAM3544 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3544 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49582] It is appreciated that VGAM3544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3544 host target genes. The mRNA of each one of this plurality of VGAM3544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3544 RNA, herein designated VGAM RNA, and which when bound by VGAM3544 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3544 host target proteins.

[49583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3544 gene, herein designated VGAM GENE, on one or more VGAM3544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49584] It is yet further appreciated that a function of VGAM3544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3544 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3544 correlate with, and may be deduced from, the identity of the host target genes which VGAM3544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49585] Nucleotide sequences of the VGAM3544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3544 are further described hereinbelow with reference to Table 1.

[49586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3544 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49587] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3545 (VGAM3545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49588] VGAM3545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3545 was detected is described hereinabove with reference to Figs. 2-8.

[49589] VGAM3545 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 4. VGAM3545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49590] VGAM3545 gene, herein designated VGAM GENE, encodes a VGAM3545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3545 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3545 precursor RNA is designated SEQ ID:80412, and is provided hereinbelow with reference to the sequence listing part.

[49591] VGAM3545 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49592] An enzyme complex designated DICER COMPLEX, dices the VGAM3545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3545 RNA is designated SEQ ID:80413, and is provided hereinbelow with reference to the sequence listing part.

[49593] VGAM3545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3545 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49594] VGAM3545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3545 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49595] The complementary binding of VGAM3545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3545 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3545 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49596] It is appreciated that VGAM3545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3545 host target genes. The mRNA of each one of this plurality of VGAM3545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3545 RNA, herein designated VGAM RNA, and which when bound by VGAM3545 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3545 host target proteins.

[49597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3545 gene, herein designated VGAM GENE, on one or more VGAM3545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49598] It is yet further appreciated that a function of VGAM3545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3545 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3545 correlate with, and may be deduced from, the identity of the host target genes which VGAM3545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49599] Nucleotide sequences of the VGAM3545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3545 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3545 are further described hereinbelow with reference to Table 1.

[49600] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3545 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49601] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3546 (VGAM3546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49602] VGAM3546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3546 was detected is described hereinabove with reference to Figs. 2-8.

[49603] VGAM3546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1.

VGAM3546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49604] VGAM3546 gene, herein designated VGAM GENE, encodes a VGAM3546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3546 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3546 precursor RNA is designated SEQ ID:80442, and is provided hereinbelow with reference to the sequence listing part.

[49605] VGAM3546 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49606] An enzyme complex designated DICER COMPLEX, dices

the VGAM3546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3546 RNA is designated SEQ ID:80443, and is provided hereinbelow with reference to the sequence listing part.

[49607] VGAM3546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3546 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49608] VGAM3546 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3546 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3546 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49609] The complementary binding of VGAM3546 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3546 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49610] It is appreciated that VGAM3546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3546 host target genes. The mRNA of each one of this plurality of VGAM3546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3546 RNA, herein designated VGAM RNA, and which when bound by VGAM3546 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3546 host target proteins.

[49611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3546 gene, herein designated VGAM GENE, on one or more VGAM3546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49612] It is yet further appreciated that a function of VGAM3546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3546 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3546 correlate with, and may be deduced from, the identity of the host target genes which VGAM3546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49613] Nucleotide sequences of the VGAM3546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3546 are further described hereinbelow with reference to Table 1.

[49614] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49615] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3547 (VGAM3547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49616] VGAM3547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3547 was detected is described hereinabove with reference to Figs. 2-8.

[49617] VGAM3547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aleutian mink disease virus. VGAM3547 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49618] VGAM3547 gene, herein designated VGAM GENE, encodes a VGAM3547 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3547 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3547 precursor RNA is designated SEQ ID:80470, and is provided hereinbelow with reference to the sequence listing part.

[49619] VGAM3547 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49620] An enzyme complex designated DICER COMPLEX, dices the VGAM3547 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3547 RNA is designated SEQ ID:80471, and is provided hereinbelow with reference to the sequence listing part.

[49621] VGAM3547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3547 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49622] VGAM3547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3547 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3547 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49623] The complementary binding of VGAM3547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3547

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49624] It is appreciated that VGAM3547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3547 host target genes. The mRNA of each one of this plurality of VGAM3547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3547 RNA, herein designated VGAM RNA, and which when bound by VGAM3547 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3547 host target proteins.

[49625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3547 gene, herein designated VGAM GENE, on one or more VGAM3547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49626] It is yet further appreciated that a function of VGAM3547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3547 include diagnosis, prevention and treatment of viral infection by Aleutian mink disease virus. Specific functions, and accordingly utilities, of VGAM3547 correlate with, and may be deduced from, the identity of the host target genes which VGAM3547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49627] Nucleotide sequences of the VGAM3547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3547 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3547 are further described hereinbelow with reference to Table 1.

[49628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49629] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3548 (VGAM3548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49630] VGAM3548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3548 was detected is described hereinabove with reference to Figs. 2-8.

[49631] VGAM3548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM3548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[49632] VGAM3548 gene, herein designated VGAM GENE, encodes a VGAM3548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3548 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3548 precursor RNA is designated SEQ ID:80486, and is provided hereinbelow with reference to the sequence listing part.

[49633] VGAM3548 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49634] An enzyme complex designated DICER COMPLEX, dices the VGAM3548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3548 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3548 RNA is designated SEQ ID:80487, and is provided hereinbelow with reference to the sequence listing part.

[49635] VGAM3548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3548 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49636] VGAM3548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3548 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49637] The complementary binding of VGAM3548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3548 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49638] It is appreciated that VGAM3548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3548 host target genes. The mRNA of each one of this plurality of VGAM3548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3548 RNA, herein designated VGAM RNA, and which when bound by VGAM3548 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3548 host target proteins.

[49639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3548 gene, herein designated VGAM GENE, on one or more VGAM3548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49640] It is yet further appreciated that a function of VGAM3548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3548 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3548 correlate with, and may be deduced from, the identity of the host target genes which VGAM3548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49641] Nucleotide sequences of the VGAM3548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3548 are further

described hereinbelow with reference to Table 1.

[49642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49643] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3549 (VGAM3549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49644] VGAM3549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3549 was detected is described hereinabove with reference to Figs. 2-8.

[49645] VGAM3549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Banana mild mosaic virus. VGAM3549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49646] VGAM3549 gene, herein designated VGAM GENE, encodes a VGAM3549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3549 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3549 precursor RNA is designated SEQ ID:80494, and is provided hereinbelow with reference to the sequence listing part.

[49647] VGAM3549 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49648] An enzyme complex designated DICER COMPLEX, dices the VGAM3549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3549 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3549 RNA is designated SEQ ID:80495, and is provided hereinbelow with reference to the sequence listing part.

[49649] VGAM3549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49650] VGAM3549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3549 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49651] The complementary binding of VGAM3549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3549 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3549 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49652] It is appreciated that VGAM3549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3549 host target genes. The mRNA of each one of this plurality of VGAM3549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3549 RNA, herein designated VGAM RNA, and which when bound by VGAM3549 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3549 host target proteins.

[49653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3549 gene, herein designated VGAM GENE, on one or more VGAM3549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49654] It is yet further appreciated that a function of VGAM3549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3549 include diagnosis, prevention and treatment of viral infection by Banana mild mosaic virus. Specific functions, and accordingly utilities, of VGAM3549 correlate with, and may be deduced from, the identity of the host target genes which VGAM3549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49655] Nucleotide sequences of the VGAM3549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3549 are further described hereinbelow with reference to Table 1.

[49656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49657] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3550 (VGAM3550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49658] VGAM3550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3550 was detected is described hereinabove with reference to Figs. 2-8.

[49659] VGAM3550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus C. VGAM3550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49660] VGAM3550 gene, herein designated VGAM GENE, encodes

a VGAM3550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3550 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3550 precursor RNA is designated SEQ ID:80504, and is provided hereinbelow with reference to the sequence listing part.

[49661] VGAM3550 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49662] An enzyme complex designated DICER COMPLEX, dices the VGAM3550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3550 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3550 RNA is designated SEQ ID:80505, and is provided hereinbelow with reference to the sequence listing part.

[49663] VGAM3550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49664] VGAM3550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3550 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49665] The complementary binding of VGAM3550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3550 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[49666] It is appreciated that VGAM3550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3550 host target genes. The mRNA of each one of this plurality of VGAM3550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3550 RNA, herein designated VGAM RNA, and which when bound by VGAM3550 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3550 host target proteins.

[49667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3550 gene, herein designated VGAM GENE, on one or more VGAM3550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49668] It is yet further appreciated that a function of VGAM3550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3550 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus C. Specific functions, and accordingly utilities, of VGAM3550 correlate with, and may be deduced from, the identity of the host target genes which VGAM3550 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49669] Nucleotide sequences of the VGAM3550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3550 are further described hereinbelow with reference to Table 1.

[49670] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49671] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3551 (VGAM3551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49672] VGAM3551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3551 was detected is described hereinabove with reference to Figs. 2-8.

[49673] VGAM3551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49674] VGAM3551 gene, herein designated VGAM GENE, encodes a VGAM3551 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3551 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3551 precursor RNA is designated SEQ ID:80532, and is provided hereinbelow with reference to the sequence listing part.

[49675] VGAM3551 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49676] An enzyme complex designated DICER COMPLEX, dices the VGAM3551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3551 RNA is designated SEQ ID:80533, and is provided hereinbelow with reference to the sequence listing part.

[49677] VGAM3551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49678] VGAM3551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3551 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49679] The complementary binding of VGAM3551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3551 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49680] It is appreciated that VGAM3551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3551 host target genes. The mRNA of each one of this plurality of VGAM3551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3551 RNA, herein designated VGAM RNA, and which when bound by VGAM3551 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3551 host target proteins.

[49681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3551 gene, herein designated VGAM GENE, on one or more VGAM3551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49682] It is yet further appreciated that a function of VGAM3551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3551 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3551 correlate with, and may be deduced from, the identity of the host target genes which VGAM3551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49683] Nucleotide sequences of the VGAM3551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3551 are further described hereinbelow with reference to Table 1.

[49684] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49685] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3552 (VGAM3552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49686] VGAM3552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3552 was detected is described hereinabove with reference to Figs. 2-8.

[49687] VGAM3552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49688] VGAM3552 gene, herein designated VGAM GENE, encodes a VGAM3552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3552 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3552 precursor RNA is designated SEQ ID:80537, and is provided hereinbelow with reference to the sequence listing part.

[49689] VGAM3552 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49690] An enzyme complex designated DICER COMPLEX, dices the VGAM3552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3552 RNA is designated SEQ ID:80538, and is provided hereinbelow with reference to the sequence listing part.

[49691] VGAM3552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49692] VGAM3552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3552 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49693] The complementary binding of VGAM3552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3552 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49694] It is appreciated that VGAM3552 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3552 host target genes. The mRNA of each one of this plurality of VGAM3552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3552 RNA, herein designated VGAM RNA, and which when bound by VGAM3552 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3552 host target proteins.

[49695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3552 gene, herein designated VGAM GENE, on one or more VGAM3552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49696] It is yet further appreciated that a function of VGAM3552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3552 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3552 correlate with, and may be deduced from, the identity of the host target genes which VGAM3552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49697] Nucleotide sequences of the VGAM3552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3552 are further described hereinbelow with reference to Table 1.

[49698] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49699] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3553 (VGAM3553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49700] VGAM3553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3553 was detected is described hereinabove with reference to Figs. 2–8.

[49701] VGAM3553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus A. VGAM3553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49702] VGAM3553 gene, herein designated VGAM GENE, encodes a VGAM3553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3553 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3553 precursor RNA is designated SEQ ID:80555, and is provided hereinbelow with reference to the sequence listing part.

[49703] VGAM3553 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49704] An enzyme complex designated DICER COMPLEX, dices the VGAM3553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3553 RNA is designated SEQ ID:80556, and is provided hereinbelow with reference to the sequence listing part.

[49705] VGAM3553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49706] VGAM3553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3553 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49707] The complementary binding of VGAM3553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3553 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49708] It is appreciated that VGAM3553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3553 host target genes. The mRNA of each one of this plurality of VGAM3553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3553 RNA, herein designated VGAM RNA, and which when bound by VGAM3553 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3553 host target proteins.

[49709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3553 gene, herein designated VGAM GENE, on one or more VGAM3553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[49710] It is yet further appreciated that a function of VGAM3553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3553 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus A. Specific functions, and accordingly utilities, of VGAM3553 correlate with, and may be deduced from, the identity of the host target genes which VGAM3553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49711] Nucleotide sequences of the VGAM3553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3553 are further described hereinbelow with reference to Table 1.

[49712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49713] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3554 (VGAM3554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49714] VGAM3554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3554 was detected is described hereinabove with reference to Figs. 2-8.

[49715] VGAM3554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM3554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49716] VGAM3554 gene, herein designated VGAM GENE, encodes a VGAM3554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3554 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3554 precursor RNA is designated SEQ ID:80565, and is provided hereinbelow with reference to the sequence listing part.

[49717] VGAM3554 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49718] An enzyme complex designated DICER COMPLEX, dices the VGAM3554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide se-

quence of VGAM3554 RNA is designated SEQ ID:80566, and is provided hereinbelow with reference to the sequence listing part.

[49719] VGAM3554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49720] VGAM3554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3554 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49721] The complementary binding of VGAM3554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3554 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49722] It is appreciated that VGAM3554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3554 host target genes. The mRNA of

each one of this plurality of VGAM3554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3554 RNA, herein designated VGAM RNA, and which when bound by VGAM3554 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3554 host target proteins.

[49723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3554 gene, herein designated VGAM GENE, on one or more VGAM3554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[49724] It is yet further appreciated that a function of VGAM3554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3554 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3554 correlate with, and may be deduced from, the identity of the host target genes which VGAM3554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49725] Nucleotide sequences of the VGAM3554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3554 are further described hereinbelow with reference to Table 1.

[49726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3554 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[49727] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3555 (VGAM3555) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49728] VGAM3555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3555 was detected is described hereinabove with reference to Figs. 2–8.

[49729] VGAM3555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49730] VGAM3555 gene, herein designated VGAM GENE, encodes a VGAM3555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3555 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3555 precursor RNA is designated SEQ ID:80574, and is provided hereinbelow with reference to the sequence listing part.

[49731] VGAM3555 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49732] An enzyme complex designated DICER COMPLEX, dices the VGAM3555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3555 RNA is designated SEQ ID:80575,

and is provided hereinbelow with reference to the sequence listing part.

[49733] VGAM3555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49734] VGAM3555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3555 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49735] The complementary binding of VGAM3555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3555 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49736] It is appreciated that VGAM3555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3555 host target genes. The mRNA of each one of this plurality of VGAM3555 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3555 RNA, herein designated VGAM RNA, and which when bound by VGAM3555 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3555 host target proteins.

[49737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3555 gene, herein designated VGAM GENE, on one or more VGAM3555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49738] It is yet further appreciated that a function of VGAM3555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3555 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM3555 correlate with, and may be deduced from, the identity of the host target genes which VGAM3555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49739] Nucleotide sequences of the VGAM3555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM3555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3555 are further described hereinbelow with reference to Table 1.

[49740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49741] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3556 (VGAM3556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49742] VGAM3556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3556 was detected is described hereinabove with reference to Figs. 2–8.

[49743] VGAM3556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM3556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49744] VGAM3556 gene, herein designated VGAM GENE, encodes a VGAM3556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3556 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3556 precu-

sor RNA is designated SEQ ID:80578, and is provided hereinbelow with reference to the sequence listing part.

[49745] VGAM3556 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49746] An enzyme complex designated DICER COMPLEX, dices the VGAM3556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM3556 RNA is designated SEQ ID:80579, and is provided hereinbelow with reference to the se-

quence listing part.

[49747] VGAM3556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49748] VGAM3556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3556 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49749] The complementary binding of VGAM3556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3556 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49750] It is appreciated that VGAM3556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3556 host target genes. The mRNA of each one of this plurality of VGAM3556 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3556 RNA, herein designated VGAM RNA, and which when bound by VGAM3556 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3556 host target proteins.

[49751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3556 gene, herein designated VGAM GENE, on one or more VGAM3556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49752] It is yet further appreciated that a function of VGAM3556

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3556 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM3556 correlate with, and may be deduced from, the identity of the host target genes which VGAM3556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49753] Nucleotide sequences of the VGAM3556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3556 are further described hereinbelow with reference to Table 1.

[49754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49755] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3557 (VGAM3557) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49756] VGAM3557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3557 was detected is described hereinabove with reference to Figs. 2–8.

[49757] VGAM3557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Banna virus. VGAM3557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49758] VGAM3557 gene, herein designated VGAM GENE, encodes a VGAM3557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3557 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3557 precursor RNA is designated SEQ ID:80592, and is provided hereinbelow with reference to the sequence listing part.

[49759] VGAM3557 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49760] An enzyme complex designated DICER COMPLEX, dices the VGAM3557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3557 RNA is designated SEQ ID:80593, and is provided hereinbelow with reference to the sequence listing part.

[49761] VGAM3557 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49762] VGAM3557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3557 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3557 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49763] The complementary binding of VGAM3557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3557 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49764] It is appreciated that VGAM3557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3557 host target genes. The mRNA of each one of this plurality of VGAM3557 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3557 RNA, herein designated VGAM

RNA, and which when bound by VGAM3557 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3557 host target proteins.

[49765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3557 gene, herein designated VGAM GENE, on one or more VGAM3557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49766] It is yet further appreciated that a function of VGAM3557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3557 include diagnosis, prevention and treatment of viral infection by Banna virus. Specific functions, and accordingly utilities, of VGAM3557 correlate with, and may be deduced from, the identity of the host target genes which VGAM3557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49767] Nucleotide sequences of the VGAM3557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3557 are further described hereinbelow with reference to Table 1.

[49768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49769] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3558 (VGAM3558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49770] VGAM3558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3558 was detected is described hereinabove with reference to Figs. 2-8.

[49771] VGAM3558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM3558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49772] VGAM3558 gene, herein designated VGAM GENE, encodes a VGAM3558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3558 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3558 precursor RNA is designated SEQ ID:80603, and is provided hereinbelow with reference to the sequence listing part.

[49773] VGAM3558 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49774] An enzyme complex designated DICER COMPLEX, dices the VGAM3558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3558 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3558 RNA is designated SEQ ID:80604, and is provided hereinbelow with reference to the sequence listing part.

[49775] VGAM3558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3558 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49776] VGAM3558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3558 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3558 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3558 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49777] The complementary binding of VGAM3558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3558 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49778] It is appreciated that VGAM3558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3558 host target genes. The mRNA of each one of this plurality of VGAM3558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3558 RNA, herein designated VGAM RNA, and which when bound by VGAM3558 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3558 host target proteins.

[49779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3558 gene, herein designated VGAM GENE, on one or more VGAM3558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49780] It is yet further appreciated that a function of VGAM3558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3558 include diagnosis, prevention and

treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3558 correlate with, and may be deduced from, the identity of the host target genes which VGAM3558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49781] Nucleotide sequences of the VGAM3558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3558 are further described hereinbelow with reference to Table 1.

[49782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49783] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3559 (VGAM3559) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49784] VGAM3559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3559 was detected is described hereinabove with reference to Figs. 2–8.

[49785] VGAM3559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49786] VGAM3559 gene, herein designated VGAM GENE, encodes a VGAM3559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3559 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3559 precursor RNA is designated SEQ ID:80614, and is provided hereinbelow with reference to the sequence listing part.

[49787] VGAM3559 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3559 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49788] An enzyme complex designated DICER COMPLEX, dices the VGAM3559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3559 RNA is designated SEQ ID:80615, and is provided hereinbelow with reference to the sequence listing part.

[49789] VGAM3559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3559 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3559 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49790] VGAM3559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3559 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3559 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3559 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49791] The complementary binding of VGAM3559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3559 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49792] It is appreciated that VGAM3559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3559 host target genes. The mRNA of each one of this plurality of VGAM3559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3559 RNA, herein designated VGAM RNA, and which when bound by VGAM3559 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3559 host target proteins.

[49793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3559 gene, herein designated VGAM GENE, on one or more VGAM3559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49794] It is yet further appreciated that a function of VGAM3559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3559 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific

functions, and accordingly utilities, of VGAM3559 correlate with, and may be deduced from, the identity of the host target genes which VGAM3559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49795] Nucleotide sequences of the VGAM3559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3559 are further described hereinbelow with reference to Table 1.

[49796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49797] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3560 (VGAM3560) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[49798] VGAM3560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3560 was detected is described hereinabove with reference to Figs. 2–8.

[49799] VGAM3560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM3560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49800] VGAM3560 gene, herein designated VGAM GENE, encodes a VGAM3560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3560 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3560 precursor RNA is designated SEQ ID:80632, and is provided hereinbelow with reference to the sequence listing part.

[49801] VGAM3560 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3560 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49802] An enzyme complex designated DICER COMPLEX, dices the VGAM3560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3560 RNA is designated SEQ ID:80633, and is provided hereinbelow with reference to the sequence listing part.

[49803] VGAM3560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3560 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49804] VGAM3560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3560 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49805] The complementary binding of VGAM3560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3560 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49806] It is appreciated that VGAM3560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3560 host target genes. The mRNA of each one of this plurality of VGAM3560 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3560 RNA, herein designated VGAM RNA, and which when bound by VGAM3560 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3560 host target proteins.

[49807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3560 gene, herein designated VGAM GENE, on one or more VGAM3560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49808] It is yet further appreciated that a function of VGAM3560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3560 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of

VGAM3560 correlate with, and may be deduced from, the identity of the host target genes which VGAM3560 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49809] Nucleotide sequences of the VGAM3560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3560 are further described hereinbelow with reference to Table 1.

[49810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49811] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3561 (VGAM3561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[49812] VGAM3561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3561 was detected is described hereinabove with reference to Figs. 2–8.

[49813] VGAM3561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49814] VGAM3561 gene, herein designated VGAM GENE, encodes a VGAM3561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3561 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3561 precursor RNA is designated SEQ ID:80881, and is provided hereinbelow with reference to the sequence listing part.

[49815] VGAM3561 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49816] An enzyme complex designated DICER COMPLEX, dices the VGAM3561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3561 RNA is designated SEQ ID:80882, and is provided hereinbelow with reference to the sequence listing part.

[49817] VGAM3561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49818] VGAM3561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3561 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49819] The complementary binding of VGAM3561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3561 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49820] It is appreciated that VGAM3561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3561 host target genes. The mRNA of each one of this plurality of VGAM3561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3561 RNA, herein designated VGAM RNA, and which when bound by VGAM3561 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3561 host target proteins.

[49821] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3561 gene, herein designated VGAM GENE, on one or more VGAM3561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49822] It is yet further appreciated that a function of VGAM3561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3561 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3561 correlate with, and may be deduced from, the

identity of the host target genes which VGAM3561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49823] Nucleotide sequences of the VGAM3561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3561 are further described hereinbelow with reference to Table 1.

[49824] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3561 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49825] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3562 (VGAM3562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49826] VGAM3562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3562 was detected is described hereinabove with reference to Figs. 2–8.

[49827] VGAM3562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM3562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49828] VGAM3562 gene, herein designated VGAM GENE, encodes a VGAM3562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3562 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3562 precursor RNA is designated SEQ ID:80897, and is provided hereinbelow with reference to the sequence listing part.

[49829] VGAM3562 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49830] An enzyme complex designated DICER COMPLEX, dices the VGAM3562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3562 RNA is designated SEQ ID:80898, and is provided hereinbelow with reference to the sequence listing part.

[49831] VGAM3562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49832] VGAM3562 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3562 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49833] The complementary binding of VGAM3562 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3562 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49834] It is appreciated that VGAM3562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3562 host target genes. The mRNA of each one of this plurality of VGAM3562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3562 RNA, herein designated VGAM RNA, and which when bound by VGAM3562 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3562 host target proteins.

[49835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3562 gene, herein designated VGAM GENE, on one or more VGAM3562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49836] It is yet further appreciated that a function of VGAM3562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3562 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3562 correlate with, and may be deduced from, the identity of the host target genes which VGAM3562 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[49837] Nucleotide sequences of the VGAM3562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3562 are further described hereinbelow with reference to Table 1.

[49838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49839] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3563 (VGAM3563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49840] VGAM3563 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3563 was detected is described hereinabove with reference to Figs. 2–8.

[49841] VGAM3563 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM3563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49842] VGAM3563 gene, herein designated VGAM GENE, encodes a VGAM3563 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3563 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3563 precursor RNA is designated SEQ ID:80904, and is provided hereinbelow with reference to the sequence listing part.

[49843] VGAM3563 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49844] An enzyme complex designated DICER COMPLEX, dices the VGAM3563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3563 RNA is designated SEQ ID:80905, and is provided hereinbelow with reference to the sequence listing part.

[49845] VGAM3563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49846] VGAM3563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3563 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[49847] The complementary binding of VGAM3563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3563 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49848] It is appreciated that VGAM3563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3563 host target genes. The mRNA of each one of this plurality of VGAM3563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3563 RNA, herein designated VGAM RNA, and which when bound by VGAM3563 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3563 host target proteins.

[49849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3563 gene, herein designated VGAM GENE, on one or more VGAM3563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49850] It is yet further appreciated that a function of VGAM3563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3563 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM3563 correlate with, and may be deduced from, the identity of the host target genes which VGAM3563 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[49851] Nucleotide sequences of the VGAM3563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3563 are further described hereinbelow with reference to Table 1.

[49852] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49853] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3564 (VGAM3564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49854] VGAM3564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3564 was detected is described hereinabove with reference to Figs. 2–8.

[49855] VGAM3564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma mitovirus 3a. VGAM3564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49856] VGAM3564 gene, herein designated VGAM GENE, encodes a VGAM3564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3564 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3564 precursor RNA is designated SEQ ID:80920, and is provided hereinbelow with reference to the sequence listing part.

[49857] VGAM3564 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49858] An enzyme complex designated DICER COMPLEX, dices the VGAM3564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3564 RNA is designated SEQ ID:80921, and is provided hereinbelow with reference to the sequence listing part.

[49859] VGAM3564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[49860] VGAM3564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3564 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49861] The complementary binding of VGAM3564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3564 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49862] It is appreciated that VGAM3564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3564 host target genes. The mRNA of each one of this plurality of VGAM3564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3564 RNA, herein designated VGAM RNA, and which when bound by VGAM3564 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3564 host target proteins.

[49863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3564 gene, herein designated VGAM GENE, on one

or more VGAM3564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49864] It is yet further appreciated that a function of VGAM3564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3564 include diagnosis, prevention and treatment of viral infection by Ophiostoma mitovirus 3a. Specific functions, and accordingly utilities, of VGAM3564 correlate with, and may be deduced from, the identity of the host target genes which VGAM3564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49865] Nucleotide sequences of the VGAM3564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3564 are further described hereinbelow with reference to Table 1.

[49866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49867] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3565 (VGAM3565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49868] VGAM3565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3565 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[49869] VGAM3565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV–2. VGAM3565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49870] VGAM3565 gene, herein designated VGAM GENE, encodes a VGAM3565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3565 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3565 precursor RNA is designated SEQ ID:80938, and is provided hereinbelow with reference to the sequence listing part.

[49871] VGAM3565 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49872] An enzyme complex designated DICER COMPLEX, dices the VGAM3565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3565 RNA is designated SEQ ID:80939, and is provided hereinbelow with reference to the sequence listing part.

[49873] VGAM3565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49874] VGAM3565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3565 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49875] The complementary binding of VGAM3565 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3565 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49876] It is appreciated that VGAM3565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3565 host target genes. The mRNA of each one of this plurality of VGAM3565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3565 RNA, herein designated VGAM RNA, and which when bound by VGAM3565 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3565 host target proteins.

[49877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3565 gene, herein designated VGAM GENE, on one or more VGAM3565 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49878] It is yet further appreciated that a function of VGAM3565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3565 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM3565 correlate with, and may be deduced from, the identity of the host target genes which VGAM3565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49879] Nucleotide sequences of the VGAM3565 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3565 are further described hereinbelow with reference to Table 1.

[49880] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49881] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3566 (VGAM3566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49882] VGAM3566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3566 was detected is described hereinabove with reference to Figs. 2-8.

[49883] VGAM3566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM3566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49884] VGAM3566 gene, herein designated VGAM GENE, encodes a VGAM3566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3566 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3566 precursor RNA is designated SEQ ID:80942, and is provided hereinbelow with reference to the sequence listing part.

[49885] VGAM3566 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[49886] An enzyme complex designated DICER COMPLEX, dices the VGAM3566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3566 RNA is designated SEQ ID:80943, and is provided hereinbelow with reference to the sequence listing part.

[49887] VGAM3566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49888] VGAM3566 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3566 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49889] The complementary binding of VGAM3566 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3566 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49890] It is appreciated that VGAM3566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3566 host target genes. The mRNA of each one of this plurality of VGAM3566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3566 RNA, herein designated VGAM RNA, and which when bound by VGAM3566 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3566 host target proteins.

[49891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3566 gene, herein designated VGAM GENE, on one or more VGAM3566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49892] It is yet further appreciated that a function of VGAM3566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3566 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM3566 correlate with, and may be deduced from, the identity of the host target genes which VGAM3566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49893] Nucleotide sequences of the VGAM3566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3566 are further described hereinbelow with reference to Table 1.

[49894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49895] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3567 (VGAM3567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49896] VGAM3567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3567 was detected is described hereinabove with reference to Figs. 2-8.

[49897] VGAM3567 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Gallid herpesvirus 3. VGAM3567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49898] VGAM3567 gene, herein designated VGAM GENE, encodes a VGAM3567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3567 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3567 precursor RNA is designated SEQ ID:80947, and is provided hereinbelow with reference to the sequence listing part.

[49899] VGAM3567 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49900] An enzyme complex designated DICER COMPLEX, dices the VGAM3567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3567 RNA is designated SEQ ID:80948, and is provided hereinbelow with reference to the sequence listing part.

[49901] VGAM3567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3567 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49902] VGAM3567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3567 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3567 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49903] The complementary binding of VGAM3567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3567 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3567 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49904] It is appreciated that VGAM3567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3567 host target genes. The mRNA of each one of this plurality of VGAM3567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3567 RNA, herein designated VGAM RNA, and which when bound by VGAM3567 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3567 host target proteins.

[49905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3567 gene, herein designated VGAM GENE, on one or more VGAM3567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49906] It is yet further appreciated that a function of VGAM3567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3567 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3567 correlate with, and may be deduced from, the identity of the host target genes which VGAM3567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49907] Nucleotide sequences of the VGAM3567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3567 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3567 are further described hereinbelow with reference to Table 1.

[49908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49909] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3568 (VGAM3568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49910] VGAM3568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3568 was detected is described hereinabove with reference to Figs. 2-8.

[49911] VGAM3568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus.

VGAM3568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49912] VGAM3568 gene, herein designated VGAM GENE, encodes a VGAM3568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3568 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3568 precursor RNA is designated SEQ ID:80950, and is provided hereinbelow with reference to the sequence listing part.

[49913] VGAM3568 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49914] An enzyme complex designated DICER COMPLEX, dices

the VGAM3568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3568 RNA is designated SEQ ID:80951, and is provided hereinbelow with reference to the sequence listing part.

[49915] VGAM3568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3568 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49916] VGAM3568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3568 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3568 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49917] The complementary binding of VGAM3568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3568 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM3568 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49918] It is appreciated that VGAM3568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3568 host target genes. The mRNA of each one of this plurality of VGAM3568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3568 RNA, herein designated VGAM RNA, and which when bound by VGAM3568 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3568 host target proteins.

[49919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3568 gene, herein designated VGAM GENE, on one or more VGAM3568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49920] It is yet further appreciated that a function of VGAM3568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3568 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM3568 correlate with, and may be deduced from, the identity of the host target genes which VGAM3568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49921] Nucleotide sequences of the VGAM3568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM3568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3568 are further described hereinbelow with reference to Table 1.

[49922] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49923] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3569 (VGAM3569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49924] VGAM3569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3569 was detected is described hereinabove with reference to Figs. 2-8.

[49925] VGAM3569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3569 host target gene, herein design-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49926] VGAM3569 gene, herein designated VGAM GENE, encodes a VGAM3569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3569 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3569 precursor RNA is designated SEQ ID:80959, and is provided hereinbelow with reference to the sequence listing part.

[49927] VGAM3569 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49928] An enzyme complex designated DICER COMPLEX, dices the VGAM3569 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3569 RNA is designated SEQ ID:80960, and is provided hereinbelow with reference to the sequence listing part.

[49929] VGAM3569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3569 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49930] VGAM3569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3569 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3569 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3569 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49931] The complementary binding of VGAM3569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3569

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49932] It is appreciated that VGAM3569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3569 host target genes. The mRNA of each one of this plurality of VGAM3569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3569 RNA, herein designated VGAM RNA, and which when bound by VGAM3569 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3569 host target proteins.

[49933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3569 gene, herein designated VGAM GENE, on one or more VGAM3569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49934] It is yet further appreciated that a function of VGAM3569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3569 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3569 correlate with, and may be deduced from, the identity of the host target genes which VGAM3569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49935] Nucleotide sequences of the VGAM3569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3569 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3569 are further described hereinbelow with reference to Table 1.

[49936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49937] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3570 (VGAM3570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49938] VGAM3570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3570 was detected is described hereinabove with reference to Figs. 2-8.

[49939] VGAM3570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple chlorotic leaf spot virus. VGAM3570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[49940] VGAM3570 gene, herein designated VGAM GENE, encodes a VGAM3570 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3570 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3570 precursor RNA is designated SEQ ID:80969, and is provided hereinbelow with reference to the sequence listing part.

[49941] VGAM3570 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49942] An enzyme complex designated DICER COMPLEX, dices the VGAM3570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3570 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3570 RNA is designated SEQ ID:80970, and is provided hereinbelow with reference to the sequence listing part.

[49943] VGAM3570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3570 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49944] VGAM3570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3570 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49945] The complementary binding of VGAM3570 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3570 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49946] It is appreciated that VGAM3570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3570 host target genes. The mRNA of each one of this plurality of VGAM3570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3570 RNA, herein designated VGAM RNA, and which when bound by VGAM3570 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3570 host target proteins.

[49947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3570 gene, herein designated VGAM GENE, on one or more VGAM3570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49948] It is yet further appreciated that a function of VGAM3570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3570 include diagnosis, prevention and treatment of viral infection by Apple chlorotic leaf spot virus. Specific functions, and accordingly utilities, of VGAM3570 correlate with, and may be deduced from, the identity of the host target genes which VGAM3570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49949] Nucleotide sequences of the VGAM3570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3570 are further

described hereinbelow with reference to Table 1.

[49950] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49951] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3571 (VGAM3571) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49952] VGAM3571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3571 was detected is described hereinabove with reference to Figs. 2-8.

[49953] VGAM3571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human respiratory syncytial virus. VGAM3571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49954] VGAM3571 gene, herein designated VGAM GENE, encodes

a VGAM3571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3571 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3571 precursor RNA is designated SEQ ID:80978, and is provided hereinbelow with reference to the sequence listing part.

[49955] VGAM3571 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49956] An enzyme complex designated DICER COMPLEX, dices the VGAM3571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3571 RNA is designated SEQ ID:80979, and is provided hereinbelow with reference to the sequence listing part.

[49957] VGAM3571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49958] VGAM3571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3571 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49959] The complementary binding of VGAM3571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3571 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[49960] It is appreciated that VGAM3571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3571 host target genes. The mRNA of each one of this plurality of VGAM3571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3571 RNA, herein designated VGAM RNA, and which when bound by VGAM3571 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3571 host target proteins.

[49961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3571 gene, herein designated VGAM GENE, on one or more VGAM3571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49962] It is yet further appreciated that a function of VGAM3571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3571 include diagnosis, prevention and treatment of viral infection by Human respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3571 correlate with, and may be deduced from, the identity of the host target genes which VGAM3571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49963] Nucleotide sequences of the VGAM3571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3571 are further described hereinbelow with reference to Table 1.

[49964] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49965] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3572 (VGAM3572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49966] VGAM3572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3572 was detected is described hereinabove with reference to Figs. 2-8.

[49967] VGAM3572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple latent spherical virus. VGAM3572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49968] VGAM3572 gene, herein designated VGAM GENE, encodes a VGAM3572 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3572 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3572 precursor RNA is designated SEQ ID:80988, and is provided hereinbelow with reference to the sequence listing part.

[49969] VGAM3572 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49970] An enzyme complex designated DICER COMPLEX, dices the VGAM3572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3572 RNA is designated SEQ ID:80989, and is provided hereinbelow with reference to the sequence listing part.

[49971] VGAM3572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49972] VGAM3572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3572 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49973] The complementary binding of VGAM3572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3572 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49974] It is appreciated that VGAM3572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3572 host target genes. The mRNA of each one of this plurality of VGAM3572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3572 RNA, herein designated VGAM RNA, and which when bound by VGAM3572 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3572 host target proteins.

[49975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3572 gene, herein designated VGAM GENE, on one or more VGAM3572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49976] It is yet further appreciated that a function of VGAM3572 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3572 include diagnosis, prevention and treatment of viral infection by Apple latent spherical virus. Specific functions, and accordingly utilities, of VGAM3572 correlate with, and may be deduced from, the identity of the host target genes which VGAM3572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49977] Nucleotide sequences of the VGAM3572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3572 are further described hereinbelow with reference to Table 1.

[49978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49979] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3573 (VGAM3573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49980] VGAM3573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3573 was detected is described hereinabove with reference to Figs. 2-8.

[49981] VGAM3573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM3573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49982] VGAM3573 gene, herein designated VGAM GENE, encodes a VGAM3573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3573 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3573 precursor RNA is designated SEQ ID:80992, and is provided hereinbelow with reference to the sequence listing part.

[49983] VGAM3573 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49984] An enzyme complex designated DICER COMPLEX, dices the VGAM3573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3573 RNA is designated SEQ ID:80993, and is provided hereinbelow with reference to the sequence listing part.

[49985] VGAM3573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[49986] VGAM3573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3573 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[49987] The complementary binding of VGAM3573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3573 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49988] It is appreciated that VGAM3573 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3573 host target genes. The mRNA of each one of this plurality of VGAM3573 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3573 RNA, herein designated VGAM RNA, and which when bound by VGAM3573 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3573 host target proteins.

[49989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3573 gene, herein designated VGAM GENE, on one or more VGAM3573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[49990] It is yet further appreciated that a function of VGAM3573 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3573 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM3573 correlate with, and may be deduced from, the identity of the host target genes which VGAM3573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49991] Nucleotide sequences of the VGAM3573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3573 are further described hereinbelow with reference to Table 1.

[49992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49993] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3574 (VGAM3574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49994] VGAM3574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3574 was detected is described hereinabove with reference to Figs. 2–8.

[49995] VGAM3574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1. VGAM3574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49996] VGAM3574 gene, herein designated VGAM GENE, encodes a VGAM3574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3574 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3574 precursor RNA is designated SEQ ID:80999, and is provided hereinbelow with reference to the sequence listing part.

[49997] VGAM3574 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49998] An enzyme complex designated DICER COMPLEX, dices the VGAM3574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3574 RNA is designated SEQ ID:81000, and is provided hereinbelow with reference to the sequence listing part.

[49999] VGAM3574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50000] VGAM3574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3574 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50001] The complementary binding of VGAM3574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3574 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50002] It is appreciated that VGAM3574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3574 host target genes. The mRNA of each one of this plurality of VGAM3574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3574 RNA, herein designated VGAM RNA, and which when bound by VGAM3574 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3574 host target proteins.

[50003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3574 gene, herein designated VGAM GENE, on one or more VGAM3574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [50004] It is yet further appreciated that a function of VGAM3574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3574 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM3574 correlate with, and may be deduced from, the identity of the host target genes which VGAM3574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [50005] Nucleotide sequences of the VGAM3574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3574 are further described hereinbelow with reference to Table 1.
- [50006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50007] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3575 (VGAM3575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50008] VGAM3575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3575 was detected is described hereinabove with reference to Figs. 2-8.

[50009] VGAM3575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM3575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50010] VGAM3575 gene, herein designated VGAM GENE, encodes a VGAM3575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3575 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3575 precursor RNA is designated SEQ ID:81003, and is provided hereinbelow with reference to the sequence listing part.

[50011] VGAM3575 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50012] An enzyme complex designated DICER COMPLEX, dices the VGAM3575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3575 RNA is designated SEQ ID:81004, and is provided hereinbelow with reference to the sequence listing part.

[50013] VGAM3575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50014] VGAM3575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3575 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50015] The complementary binding of VGAM3575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3575 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50016] It is appreciated that VGAM3575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3575 host target genes. The mRNA of

each one of this plurality of VGAM3575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3575 RNA, herein designated VGAM RNA, and which when bound by VGAM3575 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3575 host target proteins.

[50017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3575 gene, herein designated VGAM GENE, on one or more VGAM3575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[50018] It is yet further appreciated that a function of VGAM3575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3575 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM3575 correlate with, and may be deduced from, the identity of the host target genes which VGAM3575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50019] Nucleotide sequences of the VGAM3575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3575 are further described hereinbelow with reference to Table 1.

[50020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3575 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[50021] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3576 (VGAM3576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50022] VGAM3576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3576 was detected is described hereinabove with reference to Figs. 2–8.

[50023] VGAM3576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sugarcane striate mosaic associated virus. VGAM3576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50024] VGAM3576 gene, herein designated VGAM GENE, encodes a VGAM3576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3576 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3576 precursor RNA is designated SEQ ID:81018, and is provided hereinbelow with reference to the sequence listing part.

[50025] VGAM3576 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50026] An enzyme complex designated DICER COMPLEX, dices the VGAM3576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3576 RNA is designated SEQ ID:81019,

and is provided hereinbelow with reference to the sequence listing part.

[50027] VGAM3576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50028] VGAM3576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3576 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50029] The complementary binding of VGAM3576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3576 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50030] It is appreciated that VGAM3576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3576 host target genes. The mRNA of each one of this plurality of VGAM3576 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3576 RNA, herein designated VGAM RNA, and which when bound by VGAM3576 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3576 host target proteins.

[50031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3576 gene, herein designated VGAM GENE, on one or more VGAM3576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[50032] It is yet further appreciated that a function of VGAM3576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3576 include diagnosis, prevention and treatment of viral infection by Sugarcane striate mosaic associated virus. Specific functions, and accordingly utilities, of VGAM3576 correlate with, and may be deduced from, the identity of the host target genes which VGAM3576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50033] Nucleotide sequences of the VGAM3576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3576 are further described hereinbelow with reference to Table 1.

[50034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50035] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3577 (VGAM3577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50036] VGAM3577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3577 was detected is described hereinabove with reference to Figs. 2–8.

[50037] VGAM3577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50038] VGAM3577 gene, herein designated VGAM GENE, encodes a VGAM3577 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3577 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3577 precu-

sor RNA is designated SEQ ID:81049, and is provided hereinbelow with reference to the sequence listing part.

[50039] VGAM3577 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM3577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50040] An enzyme complex designated DICER COMPLEX, dices the VGAM3577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3577 RNA is designated SEQ ID:81050, and is provided hereinbelow with reference to the se-

quence listing part.

[50041] VGAM3577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[50042] VGAM3577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3577 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[50043] The complementary binding of VGAM3577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3577 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50044] It is appreciated that VGAM3577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3577 host target genes. The mRNA of each one of this plurality of VGAM3577 host target genes comprises one or more host target binding sites, each
